Automated Retinal Image Analysis for Detection and Measurements of Tortuosity and Exudates, 2014 In the last few decades an automated retinal image analysis for a diabetic retinopathy has been a major area of attention in the computer vision. The typical approach used by Ophthalmologists for examining the eye is the pupil dilation. This takes time, is not accurate and is uncomfortable for patients. On the other hand the automated retinal image analysis for retina pathologies is more sophisticated technology by which Ophthalmologists could screen the retina of the eye regularly and find out its normal and abnormal structures in a more precise and comfortable way. Monitoring the retina of the eye utilizing an automatic method and by applying necessary cure in advance could save patients from losing their vision. In recent time there were many research works on automated detection and classification of the features of the eye in the fundus normal structures and abnormal structures retina pathologies using different strategies and algorithms to obtain precise results. But they still do not meet many of the requirements. In this research we consider the retinal images taken from non-dilated eye pupils to eliminate the dilation process. These images are noisy, lower in contrast, lower in intensity and have more non-uniform luminosity due to a non-dilation process and retinal camera. The contributions of this research are robust algorithms and methods that detect and extract as well as measure the landmark features of the retina such as the optic disc and blood vessels as well as the abnormal structures such as blood vessel tortuosity, hard exudates and soft exudates, cotton wool spots and an age-related macular degeneration drusens. This provides early detection and monitoring of retina pathologies for a patient that can be

cured by ophthalmologists prior to blindness We investigated our developed algorithm by applying it to a number of retinal images with noise low intensity less color contrast and non uniform luminosity which are taken from non dilated eye pupil In addition to that these images carry distinct kinds of retina pathologies such as exudates drusens and tortuosity
