NIMS has long worked on developing advanced steel techniques, namely producing advanced steels by using only simple alloying elements such as carbon, manganese and silicon, and also by utilizing steel scrap. The hope is that this approach will lead to a technology of a so-called steel-to-steel recycling process with the ultimate goal of a recycling process such as an automotive steel-to-automotive steel recycling process to take the place of the current cascade-type recycling system. The main idea is to utilize ultra-grain refining structures and hetero structures as well as martensite structures. In particular, the focus of this book is on tensile strength and toughness of advanced steels from both the fundamental and engineering points of view. Fundamentally, a unique approach to analysis is taken based on fracture surface energy as effective grain size is employed to better understand the mechanism of property improvement. From the engineering point of view, in fracture toughness, such factors as crack tip opening displacement (CTOD) of advanced steels are
