**Advanced Neuroimaging Methods for Studying Autism Disorder** Alessandro Grecucci,Roma Siugzdaite,Remo Job,2017-11-16 In the last twenty years many attempts have been made to provide neurobiological models of autism Functional structural and connectivity analyses have highlighted reduced responses in key social areas such as amygdala medial prefrontal cortex cingulate cortex and superior temporal sulcus However these studies present discrepant results and some of them have been questioned for methodological limitations The aim of this research topic is to present advanced neuroimaging methods able to capture the complexity of the neural deficits displayed in autism This special issue presents new studies using structural and functional MRI as well as magnetoencephalography and novel protocols to analyze data Analysis of Cluster Variability Noise Reduction Strategies Source based Morphometry Functional Connectivity Density Restriction Spectrum Imaging and the others We believe it is time to integrate data provided by different techniques and methodologies in order to have a better understanding of autism

**Advanced fNIRS Applications in Neuroscience and Neurological Disorders** Daifa Wang, Dan Zhang,Jaeyoung Shin ,Wentian Dong,Huiting Qiao,2025-10-22 This Research Topic aims to illuminate the advancements functional near infrared spectroscopy technology fNIRS brings to neuroscience and neurological disorders With its non invasive cost effective and highly compatible application fNIRS offers unparalleled

opportunities for research in the real world. This advanced imaging modality deepens our grasp of brain mechanisms in both wellness and illness, enhancing the potential for early diagnosis and laying the groundwork for personalized precision medicine. fNIRS propels forward our knowledge in the neuroscience domain especially concerning neurological conditions. It opens new doors for the development of groundbreaking diagnostic and therapeutic approaches, marking a significant leap in how we confront and manage these disorders. We are particularly interested in submissions that explore innovative fNIRS applications across various neurological conditions including but not limited to mental health disorders, neurodevelopmental disorders in children, neurodegenerative diseases, and cerebrovascular diseases. This collection will also delve into the integration of fNIRS with other neuroimaging modalities, showcasing how such synergies can unlock new insights into brain dynamics and pave the way for novel diagnostic and therapeutic approaches.

### **The Emerging Role of Advanced**

**Technologies in Neurological Diseases** Arbi, Adnène, Ameur, Walid Ben, 2025-12-10 Due to their intricacy and quick progression, neurological diseases pose complex challenges to diagnostics and therapeutics. In recent years, the advancement of technologies has revolutionized the field of neurology as they have enhanced our understanding of brain functions. As research and clinical practice increasingly embrace these innovations, they hold the potential to transform the management of neurological disorders, offering new hope for patients and redefining the future of neurological care. *The Emerging Role of Advanced Technologies in Neurological Diseases* explores the shift in the way neurological diseases are treated with the advancements of technology. This book explores how advanced technologies are playing an increasingly important role in the field of neurological health and disease. Covering topics such as algorithmic biases, neural networks, and virtual reality, this book is an excellent resource for clinicians, researchers, academicians, hospital administrators, medical practitioners, and more.

**Between Theory and Clinic: The Contribution of Neuroimaging in the Field of Consciousness Disorders** Olivia Gossers, Steven Laureys, Caroline Schnakers, 2019-05-16 The amount of patients surviving severe brain injury has gradually increased over these last decades, thanks to the development of intensive care. These patients either recover quickly from coma or go through prolonged disorders of consciousness such as vegetative state, unresponsive wakefulness syndrome (VS/UWS), or minimally conscious state (MCS). While patients in a minimally conscious state are to some extent aware of themselves and the environment and show fluctuating but reproducible signs of consciousness, patients in a vegetative state (unresponsive wakefulness syndrome) are awake but only show reflexive behaviors. These patients are unable to communicate and present vigilance fluctuation, sensory deficits, as well as severe motor and language impairments. Even though behavioral assessment currently remains the gold standard for diagnosis, a number of studies highlights the difficulty in making the distinction between conscious and unconscious patients based on clinical examinations and show a misdiagnosis rate as high as 40%. Misdiagnosis can nevertheless have serious consequences on

patient's management medically but also ethically i.e. regarding end of life decision. The emergence of functional neuroimaging techniques such as positron emission tomography PET and functional magnetic resonance imaging fMRI opened new opportunities to study brain activity in patients with disorders of consciousness DOC. Recent neuroimaging tools have brought new understandings on how the brain functions after coma and how these tools can complement bedside assessment by improving diagnosis and prognosis of DOC patients. Indeed we know now that most patients in VS UWS present partial activation of sensory networks and impaired functional connectivity contrary to patients in MCS. The reemergence of thalamo cortical connections has also been associated with recovery of consciousness whereas thalamic atrophy has been associated to chronic DOC. Recent findings have also stressed the interest of neuroimaging in the management and the treatment of these patients. fMRI has been used as brain computer interfaces to detect consciousness in unresponsive patients and to allow basic communication in minimally conscious patients. Neuroimaging techniques are also currently being used to examine the effects of potential therapy such as pharmacological medications e.g. Amantadine or Zolpidem and brain stimulations e.g. transcranial direct current stimulation or repetitive transcranial magnetic stimulation.
