From Classical Analysis to Analysis on Fractals Patricia Alonso Ruiz, Michael Hinz, Kasso A. Okoudjou, Luke G. Rogers, Alexander Teplyaev, 2023-10-24 Over the course of his distinguished career Robert Strichartz 1943-2021 had a substantial impact on the field of analysis with his deep original results in classical harmonic functional and spectral analysis and in the newly developed analysis on fractals This is the first volume of a tribute to his work and legacy featuring chapters that reflect his mathematical interests written by his colleagues and friends An introductory chapter summarizes his broad and varied mathematical work and highlights his profound contributions as a mathematical mentor The remaining articles are grouped into three sections functional and harmonic analysis on Euclidean spaces analysis on manifolds and analysis on fractals and explore Strichartz contributions to these areas as well as some of the latest developments

**Realtime Data Mining** Alexander Paprotny, Michael Thess, 2013-12-03 Describing novel mathematical concepts for recommendation engines Realtime Data Mining Self Learning Techniques for Recommendation Engines features

a sound mathematical framework unifying approaches based on control and learning theories tensor factorization and hierarchical methods Furthermore it presents promising results of numerous experiments on real world data The area of realtime data mining is currently developing at an exceptionally dynamic pace and realtime data mining systems are the counterpart of today s classic data mining systems Whereas the latter learn from historical data and then use it to deduce necessary actions realtime analytics systems learn and act continuously and autonomously In the vanguard of these new analytics systems are recommendation engines They are principally found on the Internet where all information is available in realtime and an immediate feedback is guaranteed This monograph appeals to computer scientists and specialists in machine learning especially from the area of recommender systems because it conveys a new way of realtime thinking by considering recommendation tasks as control theoretic problems Realtime Data Mining Self Learning Techniques for Recommendation Engines will also interest application oriented mathematicians because it consistently combines some of the most promising mathematical areas namely control theory multilevel approximation and tensor factorization

*The XFT Quadrature in Discrete Fourier Analysis* Rafael G. Campos, 2019-05-24 This book has two main objectives the first of which is to extend the power of numerical Fourier analysis and to show by means of theoretical examples and numerous concrete applications that when computing discrete Fourier transforms of periodic and non periodic functions the usual kernel matrix of the Fourier transform the discrete Fourier transform DFT should be replaced by another kernel matrix the eXtended Fourier transform XFT since the XFT matrix appears as a convergent quadrature of a more general transform the fractional Fourier transform In turn the book s second goal is to present the XFT matrix as a finite dimensional transformation that links certain discrete operators in the same way that the corresponding continuous operators are related by the Fourier transform and to show that the XFT matrix accordingly generates sequences of matrix operators that represent continuum operators and which allow these operators to be studied from another perspective

**Transionospheric Synthetic Aperture Imaging** Mikhail Gilman, Erick Smith, Semyon Tsynkov, 2017-04-13 This landmark monograph presents the most recent mathematical developments in the analysis of ionospheric distortions of SAR images and offers innovative new strategies for their mitigation As a prerequisite to addressing these topics the book also discusses the radar ambiguity theory as it applies to synthetic aperture imaging and the propagation of radio waves through the ionospheric plasma including the anisotropic and turbulent cases In addition it covers a host of related subjects such as the mathematical modeling of extended radar targets as opposed to point wise targets and the scattering of radio waves off those targets as well as the theoretical analysis of the start stop approximation which is used routinely in SAR signal processing but often without proper justification The mathematics in this volume is clean and rigorous no assumptions are hidden or ambiguously stated The resulting work is truly interdisciplinary providing both a comprehensive and thorough exposition of the field as well as an accurate account of a range of relevant physical processes and phenomena The book is intended for applied mathematicians

interested in the area of radar imaging or more generally remote sensing as well as physicists and electrical electronic engineers who develop operate spaceborne SAR sensors and perform the data processing The methods in the book are also useful for researchers and practitioners working on other types of imaging Moreover the book is accessible to graduate students in applied mathematics physics engineering and related disciplines Praise for Transitionospheric Synthetic Aperture Imaging I perceive that this text will mark a turning point in the field of synthetic aperture radar research and practice I believe this text will instigate a new era of more rigorous image formation relieving the research development and practitioner communities of inconsistent physical assumptions and numerical approaches Richard Albanese Senior Scientist Albanese Defense and Energy Development LLC
