*Advances in Network and Acoustic Echo Cancellation* J. Benesty, T. Gänslер, D.R. Morgan, M.M. Sondhi, S.L.

Gay, 2013-04-17 For many decades hybrid devices have been used to connect 2 wire local circuits and 4 wire long distance circuits in telephone lines. This leads to a well known problem whereby echoes are generated. The delay introduced by telecommunication satellites exacerbated this problem and the need for new methods of echo control soon became obvious. The best solution to date for solving this problem was invented in the 1960s at Bell Labs by Kelly Logan and Sondhi and consists of identifying the echo path generated by the hybrid by means of an adaptive filter, a technique that became known as an echo canceler. The echo canceler allowed full duplex communication which was not possible with older echo suppression techniques. Later with the development of hands free teleconferencing systems, another echo problem appeared, but this time the echo was due to the coupling between the loudspeaker and microphone. It is not surprising that the same solution was proposed to solve this problem and most of today's teleconferencing systems have an acoustic echo canceler. More recently attention has been given to the very interesting problem of multichannel acoustic echo cancellation which leads to more exciting applications that take advantage of our binaural auditory system. *Handbook of Signal Processing in Acoustics* David Havelock, Sonoko Kuwano, Michael Vorländer, 2008-10-26 The Handbook of Signal Processing in Acoustics brings together a wide range of perspectives from over 100 authors to reveal the interdisciplinary nature of the subject. It brings the key issues from both acoustics and signal processing into perspective and is a unique resource for experts and practitioners alike to find new ideas and techniques within the diversity of signal processing in acoustics.

Methods for enhancing the quality of speech signals are gaining growing attention in universities and in industrial development laboratories. This book is organized in five parts. Part I gives a short introduction to acoustic echo and noise control. Part II deals with multi microphone processing. In Part III advanced methods for both linear and nonlinear echo cancellation are presented and techniques for intelligent control of hands free telephones are introduced. Part IV is devoted to noise reduction procedures. An in depth

treatment of conventional and of advanced methods is given followed by a model based approach using Kalman filters Finally in Part V selected applications of acoustic echo and noise control as well as speech and audio processing in general are outlined Topics such as auditory scene analysis wave field synthesis for spatial sound reproduction in car communication systems and hearing aids are treated    **Wiley Encyclopedia of Telecommunications, 5 Volume Set** John G.
