Szuba,2001-03-07 Introducing a groundbreaking approach to understanding measuring and applying Collective Intelligence Does Collective Intelligence CI exist and if so how can it be characterized quantified and harnessed Questions such as these continue to be hotly debated within both the scientific and philosophical communities Yet few researchers working in the fields of artificial intelligence or distributed computing doubt CI s enormous potential value to the future of computing Unfortunately for lack of a rigorous formal theory of Collective Intelligence most attempts to analyze CI systems have been disappointing at best In Computational Collective Intelligence Professor Tadeusz Szuba does much to rectify that situation by developing for the first time both a formal definition of CI and practical guidelines for its assessment and applications Working from the ground up

Dr Szuba begins with a stimulating and insightful discussion of the types of intelligence including individual artificial and collective into which he brings ideas from AI information theory and distributed computing as well as psychology sociology animal behavior cognitive science and other relevant disciplines He tackles the problem of computational models for simulating and measuring CI He explores all theoretically feasible models of CI computations and presents a groundbreaking nondeterministic approach using the Random PROLOG Processor RPP as a CI modeling and evaluation tool He then introduces the Collective Intelligence Quotient IQS and develops clear cut guidelines for measuring it In the final chapters he lays the foundation for a dynamic new discipline Collective Intelligence Engineering CIE and considers its potential applications as an organizational restructuring tool

New Challenges in Computational Collective Intelligence Radoslaw Katarzyniak, Adam Janiak, 2009-09-29 Collective intelligence has become one of major research issues studied by today's and future computer science Computational collective intelligence is understood as this form of group intellectual activity that emerges from collaboration and competition of many artificial individuals Robotics artificial intelligence artificial cognition and group working try to create efficient models for collective intelligence in which it emerges from sets of actions carried out by more or less intelligent individuals The major methodological theoretical and practical aspects underlying computational collective intelligence are group decision making collective action coordination collective competition and knowledge description transfer and integration Obviously the application of multiple computational technologies such as fuzzy systems evolutionary computation neural systems consensus theory knowledge representation etc is necessary to create new forms of computational collective intelligence and support existing ones Three subfields of application of computational technologies to support forms of collective intelligence are of special attention to us The first one is semantic web treated as an advanced tool that increases the collective intelligence in networking environments The second one covers social networks modeling and analysis where social networks are this area of in which various forms of computational collective intelligence emerges in a natural way The third subfield relates us to agent and multi agent systems understood as this computational and modeling paradigm which is especially tailored to capture the nature of computational collective intelligence in populations of autonomous individuals
