| Lithosphere            | 7 major and 8 minor lithospheric plates. On average plates are 125km thick, oceanic 50-100km and continental up to 200km. Made up of the crust and upper mantle it is classified as a solid. Continental crust is felsic and quartz making granite whilst oceanic is basalt. |
| Moho                   | Underneath crust. Rich in iron and magnesium - peridotite. Upper mantle of Earth.                                                                                                                                                                                            |

| Divergent              | New lithosphere is created as plates move away. Oceanic plates create ocean ridges or rises. Continental plates create rift valleys. Decompression melting as plates move away. Produces basal. Magnetic stripes help to show movement.                                      |

| Continental-continental | Creates large mountain ranges of folded rock. Earthquakes are common in these areas.                               |
| Oceanic/oceanic         | Volcanic islands form on a volcanic arc. Made out of andesite and andesite which was created through flux melting. |
| Conservative boundary   | No volcanic activity. Extensive shallow earthquakes which can occasionally have high intensity.                    |
| Hotspot                 | Caused by mantle plumes which originate at outer core. Create shield volcanoes.                                    |
