Algebraic Methods In Unstable Homotopy Theory New Mathematical Monographs:

Algebraic Methods in Unstable Homotopy Theory Joseph Neisendorfer, 2010-02-18 The most modern and thorough treatment of unstable homotopy theory available The focus is on those methods from algebraic topology which are needed in the presentation of results proven by Cohen Moore and the author on the exponents of homotopy groups The author introduces various aspects of unstable homotopy theory including homotopy groups with coefficients localization and completion the Hopf invariants of Hilton James and Toda Samelson products homotopy Bockstein spectral sequences graded Lie algebras differential homological algebra and the exponent theorems concerning the homotopy groups of spheres and Moore spaces This book is suitable for a course in unstable homotopy theory following a first course in homotopy theory It is also a valuable reference for both experts and graduate students wishing to enter the field Toric Topology Victor M. Buchstaber, Taras E. Pano, 2015-07-15 This book is about toric topology a new area of mathematics that emerged at the end of the 1990s on the border of equivariant topology algebraic and symplectic geometry combinatorics and commutative algebra It has quickly grown into a very active area with many links to other areas of mathematics and continues to attract experts from different fields The key players in toric topology are moment angle manifolds a class of manifolds with torus actions defined in combinatorial terms Construction of moment angle manifolds relates to combinatorial geometry and algebraic geometry of toric varieties via the notion of a quasitoric manifold Discovery of remarkable geometric structures on moment angle manifolds led to important connections with classical and modern areas of symplectic Lagrangian and non Kaehler complex geometry A related categorical construction of moment angle complexes and polyhedral products provides for a universal framework for many fundamental constructions of homotopical topology The study of polyhedral products is now evolving into a separate subject of homotopy theory A new perspective on torus actions has also contributed to the development of classical areas of algebraic topology such as complex cobordism This book includes many open problems and is addressed to experts interested in new ideas linking all the subjects involved as well as to graduate students and young researchers ready to enter this beautiful new area *Factorization Algebras in Quantum Field Theory: Volume 2* Kevin Costello, Owen Gwilliam, 2021-09-23 Factorization algebras are local to global objects that play a role in classical and quantum field theory that is similar to the role of sheaves in geometry they conveniently organize complicated information Their local structure encompasses examples like associative and vertex algebras in these examples their global structure encompasses Hochschild homology and conformal blocks In this second volume the authors show how factorization algebras arise from interacting field theories both classical and quantum and how they encode essential information such as operator product expansions Noether currents and anomalies Along with a systematic reworking of the Batalin Vilkovisky formalism via derived geometry and factorization algebras this book offers concrete examples from physics ranging from angular momentum and Virasoro symmetries to a five dimensional gauge theory **The Theory of $H(b)$ Spaces: Volume 2**

Emmanuel Fricain, Javad Mashreghi, 2016-10-20 An H^b space is defined as a collection of analytic functions that are in the image of an operator. The theory of H^b spaces bridges two classical subjects: complex analysis and operator theory, which makes it both appealing and demanding. Volume 1 of this comprehensive treatment is devoted to the preliminary subjects required to understand the foundation of H^b spaces, such as Hardy spaces, Fourier analysis, integral representation theorems, Carleson measures, Toeplitz and Hankel operators, various types of shift operators, and Clark measures. Volume 2 focuses on the central theory. Both books are accessible to graduate students as well as researchers; each volume contains numerous exercises and hints, and figures are included throughout to illustrate the theory. Together, these two volumes provide everything the reader needs to understand and appreciate this beautiful branch of mathematics. **Discriminant**

Equations in Diophantine Number Theory Jan-Hendrik Evertse, Kálmán Györy, 2017 The first comprehensive and up-to-date account of discriminant equations and their applications. For graduate students and researchers. *Potential Theory and Geometry on Lie Groups* N. Th. Varopoulos, 2020-10-22 Complete account of a new classification of connected Lie groups in two classes, including open problems to motivate further study. *Factorization Algebras in Quantum Field Theory* Kevin Costello, Owen Gwilliam, 2017 This first volume develops factorization algebras with a focus upon examples exhibiting their use in field theory, which will be useful for researchers and graduates. **Reduction Theory and Arithmetic Groups**

Joachim Schwermer, 2022-12-15 Build a solid foundation in the area of arithmetic groups and explore its inherent geometric and number-theoretical components. **Algebraic Methods Unstable Homotopy**, 2010 The most modern and thorough treatment of unstable homotopy theory available. The focus is on those methods from algebraic topology which are needed in the presentation of results proven by Cohen, Moore, and the author on the exponents of homotopy groups. The author introduces various aspects of unstable homotopy theory, including homotopy groups with coefficients, localization and completion, the Hopf invariants of Hilton, James, and Toda, Samelson products, homotopy Bockstein spectral sequences, graded Lie algebras, differential homological algebra, and the exponent theorems concerning the homotopy groups of spheres and Moore spaces. This book is suitable for a course in unstable homotopy theory following a first course in homotopy theory. It is also a valuable reference for both experts and graduate students wishing to enter the field. *Homotopical and Homological*

Algebra of Exact Couples Jonathan Peter Rogness, 2005 *Mathematical Reviews*, 1999 *Injective Objects in Categories of Unstable K -modules* Dagmar M. Meyer, 1999 **Stable and Unstable Homotopy** William G. Dwyer, 1998 This volume presents the proceedings of workshops on stable homotopy theory and on unstable homotopy theory held at The Field Institute as part of the homotopy program for the year 1996. The papers in the volume describe current research in the subject, and all included works were refereed. Rather than being a summary of work to be published elsewhere, each paper is the unique source for the new material it contains. The book contains current research from international experts in the subject area and presents open problems with directions for future research. *American Journal of Mathematics*, 1994
