the nucleotide sequence of the DNA component of chromatin constitutes the genetic material of the cell the other chromatin components and also modifications of bases in the DNA itself participate in so called epigenetic processes These processes are essential e g in ontogenesis or adaptation to environmental changes Therefore epigenetics is particularly important and elaborated in plants that show a high developmental plasticity and as sessile organisms display an enormous capacity to cope with environmental stress In these processes epigenetic mechanisms show a crosstalk with plant signaling pathways mediated by phytohormones and redox components You are welcome to read examples of current research and review articles in this hot research topic **Zebrafish Models for Human Disease Studies** Liqing Zang,Norihiro
