

Blood Vessels and Circulation

After passing from the right atrium to the right ventricle, blood is pumped into the pulmonary trunk.

The pulmonary trunk divides into the right and left pulmonary arteries, which carry deoxygenated blood to the lungs.

In the lung capillaries, CO₂ is given off, and the blood picks up O₂. Blood, now rich in O₂, flows from each lung to the left atrium.

Blood passes from the left atrium to the left ventricle. The left ventricle then pumps the blood into the aorta, which distributes the oxygenated blood through its branches to all of the body.

Blood returns from the body to the right atrium through a series of venules and veins, and the cycle continues.

Functions of the Circulatory System

Blood vessels

- form a network more complex than an interstate highway system
- carry blood to within two or three cell diameters of nearly all the trillions of cells that make up the body.
- blood flow through them is regulated, so that cells receive adequate nutrients and so that waste products are removed
- remain functional, in most cases, in excess of 70 years
- when damaged, they repair themselves

Blood vessels outside the heart are divided into two classes:

1. **Pulmonary vessels** – transport blood from the right ventricle of the heart through the lungs and back to the left atrium
2. **Systemic vessels** – transport blood from the left ventricle of the heart through all parts of the body and back to the right atrium

Together, the pulmonary vessels and the systemic vessels constitute the circulatory system.

Blood flow through the circulatory system is ensured by the pumping action of the heart. On its own, the circulatory system has five functions:

1. Carries blood
2. Exchanges nutrients, waste products, and gases with tissues
3. Transport substances
4. Helps regulate blood pressure
5. Directs blood flow to the tissues

Blood Circulation Study Guide:

Critical Care Study Guide Gerard J. Criner, Gilbert E. D'Alonzo, 2013-03-09 Critical care medicine is a dynamic and exciting arena where complex pathophysiologic states requiring extensive knowledge and clinical acumen are commonly found. Caring for critically ill patients requires an extensive knowledge of basic pathophysiology as well as awareness of the appropriate diagnostic tests and therapeutic interventions. Because this knowledge base crosses many different disciplines, introduction to caring for the intensive care patient while exciting may also be intimidating. This textbook is designed toward making the dynamic environment of the critical care unit understandable and the approach to the patient both logical and successful. The book contains three components: 1. description of the procedural tasks commonly performed for the critically ill patient; 2. explanation of the most common pathophysiologic states encountered; and 3. description of specific disease entities with details of their differential diagnosis, diagnostic strategy, and therapeutic plan. This book also uses several educational approaches that we have found useful in our own teaching sessions and prior textbooks. Clinical cases introduce chapters and highlight chapter segments to emphasize clinical relevancy. As an additional study aid, margin notes highlight important teaching points and facilitate easy review of chapter content. To consolidate the principles outlined in each chapter, review questions with full text explanations are provided at the end of each chapter. All these elements help reinforce the most important messages for the reader.
