Abstract: *Beyond modularity* attempts a synthesis of Fodor's anticonstructivist nativism and Piaget's antinativist constructivism. Contra Fodor, I argue that (1) the study of cognitive development is essential to cognitive science, (2) the modularity/central processing dichotomy is too rigid, and (3) the mind does not begin with prespecified modules; rather, development involves a gradual process of "modularization." Contra Piaget, I argue that: (1) development rarely involves stagelike domain-general change and (2) domain-specific predispositions give development a small but significant kickstart by focusing the infant's attention on proprietary inputs. Development does not stop at efficient learning. A fundamental aspect of human development ("representational redescription") is the hypothesized process by which information that is in a cognitive system becomes progressively explicit knowledge to that system. Development thus involves two complementary processes of progressive modularization and progressive "explicitation." Empirical findings on the child as linguist, physicist, mathematician, psychologist, and notator are discussed in support of the theoretical framework. Each chapter concentrates first on the initial state of the infant mind/brain and on subsequent domain-specific learning in infancy and early childhood. It then goes on to explore data, on older children's problem solving and theory building, with particular focus on evolving cognitive flexibility. Emphasis is placed throughout on the status of representations underlying different capacities and on the multiple levels at which knowledge is stored and accessible. Finally, consideration is given to the need for more formal developmental models, and a comparison is made between representational redescription and connectionist simulations of development. In conclusion, I consider what is special about human cognition by speculating on the status of representations underlying the structure of behavior in other species.

Keywords: cognitive development; connectionism; domain-specific/domain-general; modularity; nativism/constructivism; other species; phase versus stage; representational redescription

1. Taking the developmental perspective seriously

Beyond modularity: A developmental perspective on cognitive science (Karmiloff-Smith 1992a) not only aims to reach developmental psychologists, but also strives to persuade cognitive scientists to treat cognitive development as a serious theoretical science contributing to the discussion of how the human mind/brain develops and is organized internally, and not merely as a cute empirical database addressing the question of the age at which external behavior can be observed. Nowadays much of the literature focuses on what cognitive science can offer the study of development. In *Beyond modularity*, I concentrate on what a developmental perspective can offer cognitive science and attempt to pinpoint what is specifically human about human cognition.

As Piaget's conception of the sensorimotor infant is being severely undermined by new paradigms for study-ing infancy, the battle between nativism and constructivism once again rears its rather anticonstructive head. In *Beyond modularity*, I do not choose between these two epistemological stances, one arguing for predominantly built-in, domain-specific knowledge, and the other for a minimum innate underpinning to subsequent domain-general learning. Rather, I suggest that nativism (when redefined within a truly epigenetic perspective of genetic expression rather than genetic unfolding), on the one hand, and Piaget's constructivism, on the other, are complementary in fundamental ways, and that the ultimate theory of human cognition will encompass aspects of both. *Beyond modularity* is intended to excite the reader about the possibilities of a developmental perspective embracing both domain-specific predispositions and constructivism and to demonstrate that one can attribute various innate processes/structures to the human neonate without denying the crucial roles of the physical and sociocultural environments and without jeopardizing the deep-seated conviction that we are special — creative, cognitively flexible, capable of conscious reflection, novel invention, and occasional inordinate stupidity!

Beyond Modularity A Developmental Perspective On Cognitive Science:

Beyond Modularity Annette Karmiloff-Smith,1995-09-25 Taking a stand midway between Piaget s constructivism and Fodor s nativism Annette Karmiloff Smith offers an exciting new theory of developmental change that embraces both approaches She shows how each can enrich the other and how both are necessary to a fundamental theory of human cognition Karmiloff Smith shifts the focus from what cognitive science can offer the study of development to what a developmental perspective can offer cognitive science In Beyond Modularity she treats cognitive development as a serious theoretical tool presenting a coherent portrait of the flexibility and creativity of the human mind as it develops from infancy to middle childhood Language physics mathematics commonsense psychology drawing and writing are explored in terms of the relationship between the innate capacities of the human mind and subsequent representational change which allows for such flexibility and creativity Karmiloff Smith also takes up the issue of the extent to which development involves domain specific versus domain general processes She concludes with discussions of nativism and domain specificity in relation to Piagetian theory and connectionism and shows how a developmental perspective can pinpoint what is missing from connectionist models of the mind   *Beyond Modularity* ,1999   **Beyond Modularity** Annette Karmiloff-Smith,1992
