Accelerating Scientific Computing Models Using GPU Processing Raymond Forrest Flagg (III),2015 Big Data Processing With Matlab A. Smith,2017-11-12 Big data analytics examines large amounts of data to uncover hidden patterns correlations and other insights With today s technology it s possible to analyze your data and get answers from it almost immediately an effort that s slower and less efficient with more traditional business intelligence solutions MATLAB has the tools to work with large datasets and apply the necessary data analysis techniques Parallel computing allows you to carry out many calculations simultaneously Large problems can often be split into smaller ones which are then solved at the same time The main reasons to consider parallel computing are to Save time by distributing tasks and executing these simultaneously Solve big data problems by distributing data Take advantage of your desktop computer resources and scale up to clusters and cloud computing Parallel Computing Toolbox provides you with tools for a local cluster of workers on your client machine MATLAB Distributed Computing Server software allows you to run as many MATLAB workers on a remote cluster of computers as your licensing allows Most MathWorks products enable you to run applications in parallel For example Simulink models can run simultaneously in parallel MATLAB Compiler and MATLAB Compiler SDK software let you build and deploy parallel applications Several MathWorks products now offer built in support

for the parallel computing products without requiring extra coding. Many applications involve multiple segments of code, some of which are repetitive. Often you can use for loops to solve these cases. The ability to execute code in parallel on one computer or on a cluster of computers can significantly improve performance in many cases. Parallel Computing Toolbox software improves the performance of such loop execution by allowing several MATLAB workers to execute individual loop iterations simultaneously. Even running local workers all on the same machine as the client, you might see significant performance improvement on a multicore multiprocessor machine. So whether your loop takes a long time to run because it has many iterations or because each iteration takes a long time, you can improve your loop speed by distributing iterations to MATLAB workers. When working interactively in a MATLAB session, you can offload work to a MATLAB worker session to run as a batch job. The command to perform this job is asynchronous, which means that your client MATLAB session is not blocked and you can continue your own interactive session while the MATLAB worker is busy evaluating your code. The MATLAB worker can run either on the same machine as the client or if using MATLAB Distributed Computing Server on a remote cluster machine. If you have an array that is too large for your computer's memory, it cannot be easily handled in a single MATLAB session. Parallel Computing Toolbox software allows you to distribute that array among multiple MATLAB workers so that each worker contains only a part of the array. Yet you can operate on the entire array as a single entity. Each worker operates only on its part of the array, and workers automatically transfer data between themselves when necessary, as for example in matrix multiplication. A large number of matrix operations and functions have been enhanced to work directly with these arrays without further modification. When writing code for Parallel Computing Toolbox software, you should advance one step at a time in the complexity of your application. Verifying your program at each step prevents your having to debug several potential problems simultaneously. If you run into any problems at any step, along the way, back up to the previous step and reverify your code.

Approaches for MATLAB Applications Acceleration Using High Performance Reconfigurable Computers, 2003. A lot of raw computing power is needed in many scientific computing applications and simulations. MATLAB is one of the popular choices as a language for technical computing. Presented here are approaches for MATLAB-based applications acceleration using High Performance Reconfigurable Computing (HPRC) machines. Typically, these are a cluster of Von Neumann architecture-based systems with one or more FPGA reconfigurable boards. As a case study, an Image Correlation Algorithm has been ported on this architecture platform. As a second case study, the recursive training process in an Artificial Neural Network (ANN) to realize an optimum network has been accelerated by porting it to HPC Systems. The approaches taken are analyzed with respect to target scenarios, end users' perspective, programming efficiency, and performance.
