

# Multivalued Function

A multivalued function, also known as a multiple-valued function (Knopp 1996, part 1 p. 103), is a "function" that assumes two or more distinct values in its **range** for at least one point in its **domain**. While these "functions" are not **functions** in the normal sense of being **one-to-one** or **many-to-one**, the usage is so common that there is no way to dislodge it. When considering multivalued functions, it is therefore necessary to refer to usual "functions" as **single-valued functions**.

While the **trigonometric**, **hyperbolic**, **exponential**, and integer **power** functions are all **single-valued functions**, their inverses are multivalued. For example, the function  $z^2$  maps each complex number  $z$  to a well-defined number  $z^2$ , while its **inverse function**  $\sqrt{z}$  maps, for example, the value  $z = 1$  to  $\sqrt{1} = \pm 1$ . While a unique **principal value** can be chosen for such functions (in this case, the **principal square root** is the positive one), the choices cannot be made **continuous** over the whole **complex plane**. Instead, lines of **discontinuity** must occur.

proceedings of the AMS Special Session on Fractal Geometry and Dynamical Systems held at the Spring Eastern Virtual Sectional Meeting on April 1 2 2023 and the virtual Conference on Functional Analysis and Fractals organized by the Indian Institute of Information Technology Allahabad IIIT A India on February 16 18 2024 Fifty years ago Mandelbrot created a new type of geometry called fractal One of the novelties of this new mathematics is a systematic qualitative and quantitative approach to the concepts of irregular shapes and roughness Galileo said that the universe is written in mathematical language and its characters are triangles circles and other geometric figures Mandelbrot masterly defined other geometric objects whose main property is the self similarity and coined the term fractal for them Such models fit better complex patterns such as the circulatory system the coastline of a littoral country or a stock market chart One way of quantifying the complexity of such structures is the computation of their fractal dimension This book presents modern advances in the concept of dimension and its related notion of fractal measure The text is oriented to give insight into the current research in the area and it contains novel contributions of important scientists in the field The book deals with very diverse topics such as the Hausdorff dimension of a set of continued fractions dimension theory of inhomogeneous attractors ergodic conjecture of falling balls systems or Hausdorff measures to represent uncertainty in neural networks      **Iteration Theory and Its**

deals with two new types of neurons multi valued neurons and universal binary neurons These neurons are based on complex number arithmetic and are hence much more powerful than the typical neurons used in artificial neural networks Therefore networks with such neurons exhibit a broad functionality They can not only realise threshold input output maps but can also implement any arbitrary Boolean function Two learning methods are presented whereby these networks can be trained easily The broad applicability of these networks is proven by several case studies in different fields of application image processing edge detection image enhancement super resolution pattern recognition face recognition and prediction The book is hence partitioned into three almost equally sized parts a mathematical study of the unique features of these new neurons learning of networks of such neurons and application of such neural networks Most of this work was developed by the first two authors over a period of more than 10 years and was only available in the Russian literature With this book we present the first comprehensive treatment of this important class of neural networks in the open Western literature Multi Valued and Universal Binary Neurons is intended for anyone with a scholarly interest in neural network theory applications and learning It will also be of interest to researchers and practitioners in the fields of image processing pattern recognition control and robotics

Complex-Valued Neural Networks with Multi-Valued Neurons Igor Aizenberg, 2011-06-24 Complex Valued Neural Networks have higher functionality learn faster and generalize better than their real valued counterparts This book is devoted to the Multi Valued Neuron MVN and MVN based neural networks It contains a comprehensive observation of MVN theory its learning and applications MVN is a complex valued neuron whose inputs and output are located on the unit circle Its activation function is a function only of argument phase of the weighted sum MVN derivative free learning is based on the error correction rule A single MVN can learn those input output mappings that are non linearly separable in the real domain Such classical non linearly separable problems as XOR and Parity  $n$  are the simplest that can be learned by a single MVN Another important advantage of MVN is a proper treatment of the phase information These properties of MVN become even more remarkable when this neuron is used as a basic one in neural networks The Multilayer Neural Network based on Multi Valued Neurons MLMVN is an MVN based feedforward neural network Its backpropagation learning algorithm is derivative free and based on the error correction rule It does not suffer from the local minima phenomenon MLMVN outperforms many other machine learning techniques in terms of learning speed network complexity and generalization capability when solving both benchmark and real world classification and prediction problems Another interesting application of MVN is its use as a basic neuron in multi state associative memories The book is addressed to those readers who develop theoretical fundamentals of neural networks and use neural networks for solving various real world problems It should also be very suitable for Ph D and graduate students pursuing their degrees in computational intelligence
