Formal Theories of Information Giovanni Sommaruga,2009-04-07 It is commonly assumed that computers process information But what is information In a technical important but nevertheless rather narrow sense Shannon's information theory gives a response to this question This theory focuses on measuring the information content of a message Essentially this measure is the reduction of the uncertainty obtained by receiving a message The uncertainty of a situation of ignorance in turn is measured by entropy This theory has had an immense impact on the technology of information storage data compression information transmission and coding and still is a very active domain of research Shannon's theory has also attracted much interest in a more philosophic look at information although it was readily remarked that it is only a syntactic theory of information and neglects semantic issues Several attempts have been made in philosophy to give information theory a semantic flavor but still mostly based on or at least linked to Shannon's theory Approaches to semantic

information theory also very often make use of formal logic. Thereby information is linked to reasoning, deduction and inference as well as to decision making. Further, entropy and related measures were soon found to have important connotations with regard to statistical inference. Surely, statistical data and observation represent information about unknown hidden parameters. Thus, a whole branch of statistics developed around concepts of Shannon's information theory or derived from them. Also, some proper measurements appropriate for statistics like Fisher's information were proposed.
