O'Mara, 2013-11-11 We live in the silicon age and the quintessential item that defines our world is the computer Silicon chips power the computer as well as many other products for work and leisure such as calculators radios and televisions In the forty years since the transistor was invented the solid state revolution has affected the lives of almost everyone in the world Based on silicon solid state devices and integrated circuits have revolutionized electronics data processing communications and the like The computer especially the personal computer would be impossible without silicon devices Only one computer was ever built using vacuum tubes and the tubes had to be constantly replaced because they generated too much heat and burned out Silicon devices allowed for reliable switching operations in arrays of hundreds and thousands of discrete devices As a result the very substantial industrial base that existed for producing vacuum tubes disappeared with one exception That exception is of course the CRT which is evident in televisions computer displays and a host of other information display terminals Until recently there was nothing that could take its place and it seemed that the CRT would remain as the electronic medium for all except the simplest displays The CRT is about to go the way of the other vacuum tubes It's dead but doesn't know it yet High Efficiency Active Matrix Liquid Crystal Displays (HEAMLCD), 2003 This high efficiency active matrix liquid crystal display HEAMLCD effort examined several alternatives to increasing the total power efficiency of an AMLCD flat panel display FPD It was determined that the color filters passed just one sixth of incident light and that a re design of the addressed cell assembly ACA based on color separation physical phenomena represented the best new technology opportunity to improve overall display power efficiency Current liquid crystal display LCD sub pixels are covered by red green or blue absorptive color filters this method discards two thirds of available white light by structure while transmitting just 50% of the desired color Micro optical elements based on refractive diffractive or interferometric color separation were selected for pursuit in this effort A diffractive color separation filter DCSF was designed to separate the colors and focus the desired red green blue wavelength bands onto the subpixel apertures The black matrix already used in AMLCD designs is used to block the spill over of undesired wavebands from adjacent subpixels Several prototypes of a DCSF were designed fabricated tested analyzed and reported An alternative approach using reflective color separation RCS dichroic filters was also tested Several other potential techniques for improving the efficiency of AMLCD displays including inorganic light emitting diode LED backlight technology were examined and are discussed **Active Matrix Liquid Crystal Displays**, 2006 *AM-LCD 04* Ōyō Butsuri Gakkai, Denshi Jōhō Tsūshin Gakkai (Japan), 2004 *Active Matrix Liquid Crystal Display.
