Non-native Species and Their Role in the Environment Radu Cornel Guiaşu, 2016-08-01 The young field of invasion biology initially a branch of ecology and conservation biology has greatly expanded particularly in the last two and a half decades or so As a result the potential negative effects of introduced species have been widely advertised and sometimes perhaps overemphasized This book attempts to restore some balance to the current debate over the role of non native species by offering a broader perspective and taking a longer term evolutionary look at these species and their impact in their new environments The relatively arbitrary nature of terms such as native and non native and the rather inconsistent ways in which such terms are applied to biological species as well as the subjective boundaries of so called native ranges are analyzed The role of non native species in their new environments can be considerably more complex than the anti introduced species information would often suggest Thus the more positive and nuanced perspective on introduced species and their impact offered in this book is much needed and long overdue

Magness,Falk Huettmann,2018-11-05 Ecologists and natural resource managers are charged with making complex management decisions in the face of a rapidly changing environment resulting from climate change energy development urban sprawl invasive species and globalization Advances in Geographic Information System GIS technology digitization online data availability historic legacy datasets remote sensors and the ability to collect data on animal movements via satellite and GPS have given rise to large highly complex datasets These datasets could be utilized for making critical management decisions but are often messy and difficult to interpret Basic artificial intelligence algorithms i e machine learning are powerful tools that are

shaping the world and must be taken advantage of in the life sciences In ecology machine learning algorithms are critical to helping resource managers synthesize information to better understand complex ecological systems Machine Learning has a wide variety of powerful applications with three general uses that are of particular interest to ecologists 1 data exploration to gain system knowledge and generate new hypotheses 2 predicting ecological patterns in space and time and 3 pattern recognition for ecological sampling Machine learning can be used to make predictive assessments even when relationships between variables are poorly understood When traditional techniques fail to capture the relationship between variables effective use of machine learning can unearth and capture previously unattainable insights into an ecosystem s complexity Currently many ecologists do not utilize machine learning as a part of the scientific process This volume highlights how machine learning techniques can complement the traditional methodologies currently applied in this field
