Robo is inhaled into the body via a deep inspiration while its human host is sleeping. The micro-robot immediately lodges in the trachea among a group of pseudostratified, ciliated, columnar epithelial cells. Robo's initial maneuver is to get into a position for entry into one of the cells. The robot radios control command, "Might need a lifejacket." There appears to be a watery "moat" around each cell, most likely the (1) _____. The robot's location seems to be in jeopardy because of the presence of small "finger-like" projections, the (2) _____, which are swaying back and forth and threatening to "wash" the robot farther down into the respiratory tract. The robot's mechanical arm extends and grabs hold of the outer boundary of a cell, the (3) _____. Robo is instructed to "look for" (4) _____, which form (5) _____ large enough for the robot to gain entry into the cell. As it passes through the opening, its chemical sensors pick up the presence of a (6) _____ bilayer with integral proteins embedded in the membrane and (7) _____ attached to the inner membrane surface. Once inside, the trek through the cytosol or (8) _____ begins. Resistance to movement is greater inside the cell than outside because of the presence of dissolved nutrients, (9) _____, soluble and insoluble (10) _____, and waste products. The first "observation" inside the cell is what looks like a protein framework, the (11) _____, which gives the cytoplasm strength and flexibility. Formed structures, the (12) _____, are in abundance, some attached and others freely floating in the (13) _____. Robo's contact with some of the organelles is easy because they are (14) _____ while others may be difficult to get into because of the presence of a membrane. Structures such as the ribosomes, which are involved in (15) _____, and the centrioles, which direct strands of DNA during (16) _____, are noted quite easily as Robo treks through the cytosol. A small "cucumber-shaped" structure, a(n) (17) _____, is "sighted"; however, the robot's entry capabilities are fully taxed owing to the unusual double membrane. After penetrating the outer membrane, an inner membrane containing numerous folds called (18) _____ blocks further entry. The inner membrane serves to increase the surface area exposed to the fluid contents of (19) _____. The presence of (20) _____ attached to the folds would indicate that this is where (21) _____ is generated by the mitochondria. Robo senses the need for a quick "diffusion" through the outer membrane and back into the cytosol. The moving cytosol carries the micro-robot close to the center of the cell where it contacts the cell's control center, the (22) _____. Robo is small enough to pass through the double membrane, the (23) _____, because it contains (24) _____. Once inside, the environment is awesome! Nuclear organelles called (25) _____ engage in activities that would indicate that they synthesize the components of the (26) _____ since RNA and ribosomal proteins are in abundance. The fluid content of the nucleus, the (27) _____, contains ions, enzymes, RNA, DNA, and their nucleotides. The DNA strands form complex structures called (28) _____, which contain information to synthesize thousands of different proteins and control the synthesis of RNA. Robo leaves the nucleus by way of the ER or (29) _____ where it senses the manufacture of proteins at specific sites along the membrane, the (30) _____, or RER. Some of the synthesized molecules are stored, others will be transported along with the robot by transport vesicles that will deliver them to the (31) _____.
