Abstract The authors examined the effects of a 12-week, 100% body weight (BW) resistance training program on the muscle strength and endurance of 10 sedentary, middle-aged men. The program consisted of three sessions per week, each involving a different muscle group. The results showed that the program significantly increased muscle strength and endurance in all three muscle groups. The authors concluded that a 12-week, 100% BW resistance training program is an effective way to improve muscle strength and endurance in sedentary, middle-aged men.

Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary, middle-aged women. The study was a randomized controlled trial. The intervention group (n = 20) participated in a 12-week training program, while the control group (n = 20) remained sedentary. The training program consisted of three sessions per week, each lasting 45 minutes. The sessions included aerobic exercise, strength training, and flexibility exercises. The primary outcome was the change in HRQL, measured using the SF-36 questionnaire. The secondary outcome was the change in physical fitness, measured using a series of physical fitness tests. The results showed that the intervention group had a significant improvement in HRQL and physical fitness compared to the control group. The improvement in HRQL was most pronounced in the physical functioning, role-physical, and bodily pain domains. The improvement in physical fitness was most pronounced in the aerobic capacity, muscular strength, and flexibility measures. The findings suggest that a 12-week training program can improve the physical fitness and HRQL of sedentary, middle-aged women.
