Active Control Of Structures Active Control Of Structures:

Integrated Passive and Active Control of Structures Vernon H. Neubert, 1993 A combination of passive damping and active control is needed on practical structures where sufficient modal damping is not achievable with passive damping alone The modal theories for structural equations in state space are reviewed and some eigenvector relationship are presented which are not available elsewhere for use later in the report Methods for determining sensitivities of eigenvalues and eigenvectors to plant matrix and control inputs are summarized and numerical examples are presented Procedures are developed for optimizing passive damping through use of the sensitivities of the eigenproperties for free vibration and forced random vibrations Frequency dependent behavior of viscoelastic damping material by curve fitting is discussed which is then used in an overdamped mini oscillator technique for analysis of an example ten bar truss Two approaches are presented for designing the combination of passive viscous damping and full state feedback control The first is iterative and makes use of eigenvalue sensitivities The second is based on a perturbation formulation where the desired changes in eigenvalues and eigenvectors are specified and the corresponding changes in the closed loop characteristic matrix in state space are predicted Restrictions on the choice of eigenvalues and eigenvectors are discussed in light of related literature on eigenstructure assignment Fortran computer programs one coupled with the constrained function minimization program CONMIN have been written for each type of problem Space structures Passive damping Active control Analysis Numerical examples

Active Control of Structures Andre Preumont, Kazuto Seto, 2008-11-20 With *Active Control of Structures* two global pioneers present the state of the art in the theory design and application of active vibration control As the demand for high performance structural systems increases so will the demand for information and innovation in structural vibration control this book provides an effective treatise of the subject that will meet this requirement The authors introduce active vibration control through the use of smart materials and structures semi active control devices and a variety of feedback options they then discuss topics including methods and devices in civil structures modal analysis active control of high rise buildings and bridge towers active tendon control of cable structures and active and semi active isolation in mechanical structures *Active Control of Structures* Discusses new types of vibration control methods and devices including the newly developed reduced order physical modelling method for structural control Introduces triple high rise buildings connected by active control bridges as devised by Professor Seto Offers a design strategy from modelling to controller design for flexible structures Makes prolific use of practical examples and figures to describe the topics and technology in an intelligible manner

Active Control of Vibration Christopher C. Fuller, Sharon Elliott, P. A. Nelson, 1996-02-08 This book is a companion text to *Active Control of Sound* by P A Nelson and S J Elliott also published by Academic Press It summarizes the principles underlying active vibration control and its practical applications by combining material from vibrations mechanics signal processing acoustics and control theory The emphasis of the book is on the active control of waves in structures the

active isolation of vibrations the use of distributed strain actuators and sensors and the active control of structurally radiated sound The feedforward control of deterministic disturbances the active control of structural waves and the active isolation of vibrations are covered in detail as well as the more conventional work on modal feedback The principles of the transducers used as actuators and sensors for such control strategies are also given an in depth description The reader will find particularly interesting the two chapters on the active control of sound radiation from structures active structural acoustic control The reason for controlling high frequency vibration is often to prevent sound radiation and the principles and practical application of such techniques are presented here for both plates and cylinders The volume is written in textbook style and is aimed at students practicing engineers and researchers Combines material from vibrations signal processing mechanics and controls Summarizes new research in the field Active Control of Structures Nikos G. Active Control of Bidirectional Structural Vibration Wen Yu, Satyam Paul, 2020-06-05 This book focuses on safeguarding civil structures and residents from natural hazards such as earthquakes through the use of active control It proposes novel proportional derivative PD and proportional integral derivative PID controllers as well as discrete time sliding mode controllers DSMCs for the vibration control of structures involving nonlinearities Fuzzy logic techniques are used to compensate for nonlinearities The first part of the book addresses modelling and feedback control in inelastic structures and presents a design for PD PID controllers In the second part classical PD PID and type 2 fuzzy control techniques are combined to compensate for uncertainties in the structures of buildings The methodology for tuning the gains of PD PID is obtained using Lyapunov stability theory and the system's stability is verified Lastly the book puts forward a DSMC design that does not require system parameters allowing it to be more flexibly applied All program codes used in the paper are presented in a MATLAB Simulink environment Given its scope the book will be of interest to mechanical and civil engineers and to advanced undergraduate and graduate engineering students in the areas of structural engineering structural vibration and advanced control **Advanced Structural Dynamics and Active Control of Structures** Wodek
