Algorithmic Adventures From Knowledge To Magic:

Algorithmic Adventures Juraj Hromkovič, 2009-06-22 The first and foremost goal of this lecture series was to show the beauty, depth and usefulness of the key ideas in computer science. While working on the lecture notes, we came to understand that one can recognize the true spirit of a scientific discipline only by viewing its contributions in the framework of science as a whole. We present computer science here as a fundamental science that interacting with other scientific disciplines changes and changes our view on the world that contributes to our understanding of the fundamental concepts of science and that sheds new light on and brings new meaning to several of these concepts. We show that computer science is a discipline that discovers spectacular, unexpected facts that finds ways out in seemingly unsolvable situations and that can do true wonders. The message of this book is that computer science is a fascinating research area with a big impact on the real world, full of spectacular ideas and great challenges. It is an integral part of science and engineering with an above-average dynamic over the last 30 years and a high degree of interdisciplinarity. The goal of this book is not typical for popular science writing, which often restricts itself to outlining the importance of a research area. Whenever possible, we strive to bring full understanding of the concepts and results presented.

Information Michele Kennerly, Samuel Frederick, Jonathan E. Abel, 2021-01-19 For decades we have been told we live in the information age, a time when disruptive technological advancement has reshaped the categories and social uses of knowledge and when quantitative assessment is increasingly privileged. Such methodologies and concepts of information are usually considered the provenance of the natural and social sciences, which present them as politically and philosophically neutral. Yet the humanities should and do play an important role in interpreting and critiquing the historical, cultural and conceptual nature of information. This book is one of two companion volumes that explore theories and histories of information from a humanistic perspective. They consider information as a long-standing feature of social, cultural and conceptual management, a matter of social practice and a fundamental challenge for the humanities today. Bringing together essays by prominent critics, *Information: Keywords* highlights the humanistic nature of information practices and concepts by thinking through key terms. It describes and anticipates directions for how the humanities can contribute to our understanding of information from a range of theoretical, historical and global perspectives. Together with *Information: A Reader*, it sets forth a major humanistic vision of the concept of information.

Python Algorithms Magnus Lie Hetland, 2011-02-27 *Python Algorithms* explains the Python approach to algorithm analysis and design. Written by Magnus Lie Hetland, author of *Beginning Python*, this book is sharply focused on classical algorithms but it also gives a solid understanding of fundamental algorithmic problem-solving techniques. The book deals with some of the most important and challenging areas of programming and computer science but in a highly pedagogic and readable manner. The book covers both algorithmic theory and programming practice, demonstrating how theory is reflected in real Python programs. Well-known algorithms and data structures that are built into the Python language are explained, and the user is shown how to
