Applications Of Laser Plasma Interactions Series In Plasma Physics And Fluid Dynamics:

The Physics of Laser Plasmas and Applications - Volume 1 Hideaki Takabe, 2020-08-28 The series of books discusses the physics of laser and matter interaction fluid dynamics of high temperature and high density compressible plasma and kinetic phenomena and particle dynamics in laser produced plasma The book Vol 1 gives the physics of intense laser absorption in matter and or plasma in non relativistic and relativistic laser intensity regime In many cases it is explained with clear images of physics so that an intuitive understanding of individual physics is possible for non specialists For intense laser of 10^{13} 16 W cm^2 the laser energy is mainly absorbed via collisional process where the oscillation energy is converted to thermal energy by non adiabatic Coulomb collision with the ions Collisionless interactions with the collective modes in plasma are also described The main topics are the interaction of ultra intense laser and plasma for the intensity near and over 10^{18} W cm^2 In such regime relativistic dynamics become essential A new physics appears due to the relativistic effects such as mass correction relativistic nonlinear force chaos physics of particle motions and so on The book provides clearly the theoretical base for challenging the laser plasma interaction physics in the wide range of power lasers It is suitable as a textbook for upper undergraduate and graduate students as well as for readers who want to understand the whole physics structure about what happen when an intense laser irradiates any materials including solids gas etc Explaining the physics intuitively without complicated mathematics it is also a valuable resource for engineering students and researchers as well as for self study

Applications of Laser-Plasma Interactions Shalom Eliezer, Kunioki Mima, 2008-12-22 Recent advances in the development of lasers with more energy power and brightness have opened up new possibilities for exciting applications Applications of Laser Plasma Interactions reviews the current status of high power laser applications The book first explores the science and technology behind the ignition and burn of imploded fusion fuel

Library of Congress. Office for Subject Cataloging Policy, 1991 The Physics of Laser Plasmas and Applications - Volume 2 Hideaki Takabe, 2024-03-28 This open access book Volume 2 is part of the series The Physics of Laser Plasmas and Applications It serves as an introduction to the physics of compressible hydrodynamics which is used to describe the temporal evolution of plasmas generated by intense laser irradiation of solid surfaces For the benefit of students and young researchers the book presents the fundamental equations and provides a comprehensible explanation of solutions to intricate fluid phenomena It builds upon the concept of plasma generation through the heating of matter via the classical absorption of a laser as expounded in Volume 1 The high temperature plasma resulting from the laser interaction manifests in diverse hydrodynamic occurrences like shock waves and expansion waves The initial sections of this book expound the essentials of

compressible hydrodynamics magnetohydrodynamics MHD and the physics of shock waves The transfer of laser energy within an expanding plasma towards regions of higher density is achieved through electron and X ray transport mechanisms In both instances conventional diffusion models prove inadequate necessitating mathematical frameworks founded on the Boltzmann equation The conveyed energy engenders ablation pressure equivalent to tens of millions of atmospheres on the solid surface This pressure initiates powerful shock waves propagating through the solid material The propagation of these shock waves is delineated for scenarios involving planar and spherical geometries The text also introduces various solutions pertaining to convergent and divergent shocks in spherical geometries using self similar models The discourse then shifts towards ionization and related atomic processes which govern the dynamics of plasmas created by laser irradiation of mid Z and high Z solids The quantum mechanics of partially ionized atoms and their associated atomic processes are elucidated Concluding the book is an exploration of the physics of warm dense matter WDM an electron system characterized by quantum mechanical many body interactions The study of high density plasmas featuring temperatures around 1 eV is undertaken through the lens of density functional theory DFT The theoretical breakdown of experimental data acquired via the X ray free electron laser X FEL is also provided In essence this second volume of the series amalgamates a comprehensive understanding of compressible hydrodynamics shock wave physics ionization processes energy transfer and the realm of warm dense matter It equips readers to delve into the intricacies of plasma physics and laser interactions while utilizing modern theoretical frameworks and experimental methodologies This is an open access book

Laser-Plasma Interactions and Applications Paul McKenna, David Neely, Robert Bingham, Dino Jaroszynski, 2013-03-29 Laser Plasma Interactions and Applications covers the fundamental and applied aspects of high power laser plasma physics With an internationally renowned team of authors the book broadens the knowledge of young researchers working in high power laser plasma science by providing them with a thorough pedagogical grounding in the interaction of laser radiation with matter laser plasma accelerators and inertial confinement fusion The text is organised such that the theoretical foundations of the subject are discussed first in Part I In Part II topics in the area of high energy density physics are covered Parts III and IV deal with the applications to inertial confinement fusion and as a driver of particle and radiation sources respectively Finally Part V describes the principle diagnostic targetry and computational approaches used in the field This book is designed to give students a thorough foundation in the fundamental physics of laser plasma interactions It will also provide readers with knowledge of the latest research trends and elucidate future exciting challenges in laser plasma science

trend towards higher and higher laser intensities has opened the way to new physical regimes and advanced applications of laser plasma interactions thus stimulating novel connections with ultrafast optics astrophysics particle physics and biomedical applications This book is primarily oriented towards students and young researchers who need to acquire rapidly a basic knowledge of this active and rapidly changing research field To this aim the presentation is focused on a selection of basic models and inspiring examples and includes topics which emerged recently such as ion acceleration relativistic engineering and radiation friction The contents are presented in a self contained way assuming only a basic knowledge of classical electrodynamics mechanics and relativistic dynamics at the undergraduate Bachelor level without requiring any previous knowledge of plasma physics Hence the book may serve in several ways as a compact textbook for lecture courses as a short and accessible introduction for the newcomer as a quick reference for the experienced researcher and also as an introduction to some nonlinear mathematical methods through examples of their application to laser plasma modeling
