Surface Application of Paper Chemicals J. Brander, I. Thorn, 1997-09-30 With the exception of a slight hiccup during the height of the recent environmental movement during the early 1990s when for a year or two consumers were prepared to pay a price premium for lower quality recycled paper than for the virgin product the inexorable improvement in the quality demanded of paper products continues This demand for quality covers not only the aesthetics of the product but also its performance Moreover it is becoming increasingly the case that papers designed for a particular use must as it were incidentally also perform well in alternative applications An example is that of office and printing papers which are expected to perform as well in copier machines as in all the various forms of impact and non impact printers But even greater demands are made in other product areas where board designed for dry foods can also be expected to protect moist and fatty

materials and be made of 100% recycled fibre The need to isolate foodstuffs from some of the contaminants that can affect recycled board is a serious challenge Thus papermakers are constantly striving to meet a broadening spectrum of demands on their products often while accepting declining quality of raw materials The product design philosophy that has arisen in response to this is increasingly to isolate the bulk of a paper from its uses to engineer the needed performance characteristics into the paper surfaces while more or less ignoring what happens inside Aminofunctional Starch Derivatives: Synthesis, Analysis, and Application Antje Gonera,2004

The Handbook of Paper-Based Sensors and Devices Ghenadii Korotcenkov,2025-07-25 This collection on materials and technologies is the first of a three volume handbook on all aspects of paper based devices from synthesis of nanocellulose and paper fabrication to discussion of features of fabrication of various flexible sensors and electronic devices on paper substrates Subsequent volumes address sensors and bio and environment engineering electronics and energy technologies The books also present a comprehensive and detailed analysis of all aspects of applications of these sensors and devices in environment monitoring biomedicine healthcare agriculture the food industry energy electronics optoelectronics and other domains Paper based bioengineering and environment engineering are also discussed in detail in these books The books enable the reader to understand the present status of paper based sensors and devices and the role of paper in the development of new generation of sensors and electronic devices for various purposes with enhanced efficiency World renowned experts with extensive expertise in the development of nanocellulose based technology and paper based sensors and electronic devices comprise the contributors to this collection The Handbook of Paper Based Sensors and Devices is an authoritative reference for materials scientists biologists physicians and biochemical engineers as well as for chemical biomedical environmental electronics agriculture engineers and the food biotechnologists working in R Considers in detail the synthesis modification of nanocellulose intended for use in various fields Analyzes the specifics of manufacturing paper based flexible and wearable sensors and systems for various applications

Pulp and Paper Industry Pratima Bajpai,2015-04-09 Pulp and Paper Industry Microbiological Issues in Papermaking features in depth and thorough coverage of microbiological issues in papermaking and their consequences and the current state of the different alternatives for prevention treatment and control of biofilm slime considering the impact of the actual technological changes in papermaking on the control programmes The microbial issues in paper mill systems chemistry of deposits on paper machines the strategies for deposit control and methods used for the analysis of biofouling are all dealt in this book along with various growth prevention methods The traditional use of biocides is discussed taken into account the new environmental regulations regarding their use Finally discusses the trends regarding the future of the microbiological control in papermaking systems In depth coverage of microbiological issues in papermaking and their consequences Discusses eco efficient processes green processes for biofilm slime control Offers a thorough review of the current literature with links to the primary literature Comprehensive indexing Author is an authority in the pulp and paper

Goycoolea, 2019-04-23 Functional advanced biopolymers have received far less attention than renewable biomass cellulose
rubber etc used for energy production Among the most advanced biopolymers known is chitosan The term chitosan refers to
a family of polysaccharides obtained by partial de N acetylation from chitin one of the most abundant renewable resources in
the biosphere Chitosan has been firmly established as having unique material properties as well as biological activities Either
in its native form or as a chemical derivative chitosan is amenable to being processed typically under mild conditions into soft
materials such as hydrogels colloidal nanoparticles or nanofibers Given its multiple biological properties including
biodegradability antimicrobial effects gene transfectability and metal adsorption to name but a few chitosan is regarded as a
widely versatile building block in various sectors e g agriculture food cosmetics pharmacy and for various applications
medical devices metal adsorption catalysis etc This Special Issue presents an updated account addressing some of the major
applications including also chemical and enzymatic modifications of oligos and polymers A better understanding of the
properties that underpin the use of chitin and chitosan in different fields is key for boosting their more extensive industrial
utilization as well as to aid regulatory agencies in establishing specifications guidelines and standards for the different types
