

Lesson 5- Applications of Sinusoidal Functions

Example 2: Alexis and Colin own a car and a pickup truck. They noticed that the odometers of the two vehicles gave different values for the same distance. As part of their investigation into the cause, they put a chalk mark on the outer edge of a tire on each vehicle. The following graphs show the height of the tires as they rotated while the vehicles were driven at the same slow, constant speed. What can you determine about the characteristics of the tires from these graphs?

car

max - 24
min - 0

tire diameter
of 24

$$\text{mid } \frac{24+0}{2} = 12$$

Period: 1.2s

TRUCK

max 32
min 0
diameter 32

$$\text{mid } \frac{32+0}{2} = 16 \rightarrow \text{middle}$$

Period: 1.6s

$$C = 2\pi r$$

car

$$2(\pi)(12) = 75.4 \text{ in}$$

$$2(\pi)(16) = 100.5 \text{ in}$$

Digital Image Enhancement Restoration and Compression focuses on human vision based imaging application development. Examples include making poor images look better, the development of advanced compression algorithms, special effects imaging for motion pictures, and the restoration of satellite images distorted by atmospheric disturbance. This book presents a unique engineering approach to the practice of digital imaging which starts by presenting a global model to help gain an understanding of the overall process followed by a breakdown and explanation of each individual topic. Topics are presented as they become necessary for understanding the practical imaging model under study which provides the reader with the motivation to learn about and use the tools and methods being explored. The book includes chapters on imaging systems and software, the human visual system, image transforms, image filtering, image enhancement, image restoration, and image compression. Numerous examples including over 700 color images are used to illustrate the concepts discussed. Readers can explore their own application development with any programming language including C, C++, MATLAB, Python, and R and software is provided for both the Windows C++ and MATLAB environments. The book can be used by the academic community in teaching and research with over 1 000 PowerPoint slides and a complete solutions manual to the over 230 included problems. It can also be used for self study by those involved with application development whether they are engineers, scientists, or artists. The new edition has been extensively updated and includes numerous problems and programming exercises that will help the reader and student develop their skills.

2.1 Text Summarization Text summarization is the process of distilling the most important information from a source or sources to produce an abridged version for a particular user or users and task or tasks. 3 Basic and classical articles in text summarization appear in *Advances in automatic text summarization*. 3 A literature survey on information extraction and text summarization is given by Zechner. 7 In general the process of automatic text summarization is divided into three stages: 1 analysis of the given text, 2 summarization of the text, 3 presentation of the summary in a suitable output form. Titles, abstracts, and keywords are the most common summaries in Academic papers. Usually the title, the abstract, and the keywords are the first, second, and third parts of an Academic paper respectively. The title usually describes the main issue discussed in the study and the abstract presents the reader a short description of the background, the study, and its results. A keyword is either a single word unigram, e.g. learning, or a collocation which means a group of two or more words representing an important concept, e.g. machine learning, natural language processing. Retrieving collocations from text was examined by Smadja [5] and automatic extraction of collocations was examined by Kita et al. [1].

Elements of Electrical Engineering George Defrees Shepardson, 1924 *Theory and Applications of Gibbs Derivatives* Paul Leo Butzer, Radomir S. Stanković, 1990 **Higher Engineering Mathematics** N.B. Singh, Higher Engineering Mathematics is a comprehensive

textbook designed to provide students and professionals with a solid foundation in advanced mathematical techniques essential for engineering and applied sciences The book covers a wide range of topics including differential equations Fourier series Laplace transforms and complex analysis with a focus on practical applications Each chapter introduces key concepts in a clear and approachable manner supported by worked examples and problems that demonstrate how these mathematical tools are used to solve real world engineering problems Through step by step explanations and illustrative examples this book ensures that complex mathematical ideas are accessible and understandable for readers at all levels
