*Using Neurophysiological Signals that Reflect Cognitive or Affective State* Anne-Marie Brouwer, Thorsten O. Zander, Jan B. F. van Erp, 2015-07-27

What can we learn from spontaneously occurring brain and other physiological signals about an individual's cognitive and affective state and how can we make use of this information One line of research that is actively involved with this question is Passive Brain Computer Interfaces BCI To date most BCIs are aimed at assisting patients for whom brain signals could form an alternative output channel as opposed to more common human output channels like speech and moving the hands However brain signals possibly in combination with other physiological signals also form an output channel above and beyond the more usual ones they can potentially provide continuous online information about an individual's cognitive and affective state without the need of conscious or effortful communication The provided information could be used in a number of ways Examples include monitoring cognitive workload through EEG and skin conductance for adaptive automation or using ERPs in response to errors to correct for a behavioral response While Passive BCIs make use of online neuro physiological responses and close the interaction cycle between a user and a computer system neuro physiological responses can also be used in an offline fashion Examples of this include detecting amygdala responses for neuromarketing and measuring EEG and pupil dilation as indicators of mental effort for optimizing information systems The described field of applied neuro physiology can strongly benefit from high quality scientific studies that control for confounding factors and use proper comparison conditions Another area of relevance is ethics ranging from dubious product claims acceptance of the technology by the general public privacy of users to possible effects that these kinds of applications may have on society as a whole In this Research Topic we aimed to publish studies of the highest scientific quality that are directed towards applications that utilize spontaneously effortlessly generated neurophysiological signals brain and/or other physiological signals reflecting cognitive or affective state We especially welcomed studies that describe specific real world applications demonstrating a significant benefit compared to standard applications We also invited original new kinds of proposed applications in this area as well as comprehensive review articles that point out what is and what is not possible according to scientific standards in this field Finally we welcomed manuscripts on the ethical issues that are involved Connected to the Research Topic was a workshop held on June 6 during the Fifth International Brain Computer Interface Meeting June 3-7 2013 Asilomar California that brought together a diverse group of people who were working in this field We discussed the state of the art and formulated major challenges as reflected in the first paper of the Research Topic

**Principles of Drug Therapy in Neurology** Michael V. Johnston, Robert Gross, 2008-05 Principles of Drug Therapy Second Edition provides comprehensive coverage of current drug therapy in neurology while providing the background information that neurologists and other clinicians need to understand its rationale. The range of new drugs available for treatment of neurological disorders is expanding rapidly along with rapid advances in the neurosciences that are uncovering disease mechanisms. Although there are many sources of drug information, most are limited to basic information about indications, dose and side effects. However, the complexity of the nervous system is enormous and the information needed to understand drug effects is accordingly often not readily available in a single source. The book addresses this issue by presenting 18 focused disease related chapters by authors who are expert clinical sub specialists as well as experts on drug therapy. The first chapter on fundamentals of drug therapy in neurology provides a readable synopsis of how the classic pharmacology concepts such as pharmacodynamics and pharmacokinetics are related to therapy in neurology. This section also discusses the pathogenesis of potentially serious side effects such as skin rashes and liver disorders and the role of pharmacogenetics in both drug effect and side effects. Outstanding chapters on movement disorders, epilepsy and headaches cover major areas of drug treatment in neurology practice. Additional chapters cover stroke, increased intracranial pressure in

the intensive care unit dementia multiple sclerosis spinal cord injury and spasticity neuromuscular disorders and pain Sleep central nervous system infections and HIV and drug intoxications are also covered Areas of special interest to child neurologists covered in the book include treatment of genetic metabolic disorders and use of stimulants and other medications for childhood cognitive disorders An excellent chapter is also provided on drug treatment of psychiatric disorders because of the important of psychiatric drugs in neurology practice This edition has been completely re written from the successful edition published in the 90s and enlarged commensurate with the exciting progress in treatment in neurology     *ACCP Pulmonary Medicine Board Review ,2009*
