*Disassembly Modeling for Assembly, Maintenance, Reuse and Recycling*

A.J.D. (Fred) Lambert, Surendra M. Gupta, 2004-12-28 Industry has grown to recognize the value of disassembly processes across a wide range of products. Increasing legislation that may soon require mandatory recycling of many post-consumed goods and a desire to develop more environmentally benign end-of-life processes has fueled research into this concept.

Traditionally, disassembly has been viewed as a *Comprehensive Information Chain for Automated Disassembly of Obsolete Technical Appliances* Heiko Scharke, 2003 *Optimisation of Robotic Disassembly for Remanufacturing* Yuanjun

Laili, Yongjing Wang, Yilin Fang, Duc Truong Pham, 2021-08-17 This book illustrates the main characteristics, challenges and optimisation requirements of robotic disassembly. It provides a comprehensive insight on two crucial optimisation problems in the areas of robotic disassembly through a group of unified mathematical models. The online and offline optimisation of the operational sequence to dismantle a product for example is represented with a list of conflicting objectives and constraints. It allows the decision maker and the robots to match the situation automatically and efficiently. To identify a generic solution under different circumstances, classical metaheuristics that can be used for the optimisation of robotic disassembly are introduced in detail. A flexible framework is then presented to implement existing metaheuristics for sequence planning and line balancing in the circumstance of robotic disassembly. *Optimisation of Robotic Disassembly for Remanufacturing* provides practical case studies on typical product instances to help practitioners design efficient robotic disassembly with minimal manual operation and offers comparisons of the state-of-the-art metaheuristics on solving the key optimisation problems.

Therefore, it will be of interest to engineers, researchers and postgraduate students in the area of remanufacturing.

essential to remanufacturing recycling and environmentally conscious manufacturing. This pioneering work offers efficient techniques required to solve problems involving the number of workstations required and the disassembly sequencing of end of life products on the disassembly line. In this book the disassembly line balancing problem (DLBP) is described, defined mathematically and illustrated by case studies. Combinatorial optimization methodologies are presented as solutions to the DLBP. Coverage includes Graphical representations of products to be disassembled, Computational complexity of combinatorial problems, Description of the disassembly line and the mathematical model, Computational complexity of the DLBP, Combinatorial optimization searches, Experimental instances, Analytical methodologies, Exhaustive search, Genetic algorithm, Ant colony optimization, Greedy algorithm, Greedy adjacent element hill climbing, hybrid Greedy 2 opt hybrid H-K heuristic, Quantitative and qualitative comparative analysis. This authoritative volume also covers product planning line and facility design, sequencing and scheduling, inventory, just in time, revenue and unbalanced lines. *The Disassembly Line: Disassembly-line balancing* Seamus McGovern, 2011. The National Institute of Standards and Technology NISTIR 7772 Information Model for Disassembly for Reuse, Recycling, and Remanufacturing addresses the disassembly process and how it is an essential activity in the mid and end of a product's service life cycle. Maintenance is a mid product life activity which involves disassembly, cleaning, repair, replace, inspection and reassembly. Remanufacture, reuse and recycle are activities at the end of a product's service life. The main purpose of performing these activities is to increase

sustainability which includes reduce environmental impact increase economic and extend societal benefits to meet the goal of sustainable development This report describes a developed disassembly information model It is an integrated information model with the following key components feature tolerance workpiece material content equipment and process The model supports the modeling of disassembly features sequence operations decision making and workflow Case study using real products and their specific disassembly processes is provided to verify the developed model **Automobile Construction and Repair** Morris Albert Hall,1918

**A Strategic Operations Framework for Disassembly in Remanufacturing** Anjar Priyono,2015 Previous studies into the field of disassembly have widely focused on both product attributes These attributes include the number of components product structure type of materials and other geometrical information From a management perspective disassembly that focuses on these attributes is categorised as operational issues which deal with day to day decisions On the other hand organisational characteristics and process choices which are strategic in nature have generally been overlooked by previous investigations Some studies have attempted to include such variables in their analysis but these studies were not comprehensive This research therefore endeavours to address this oversight by investigating disassembly from an integrative perspective that incorporates organisational characteristics process choices and product attributes This inductive study features five remanufacturing companies as case studies in order to develop a comprehensive framework of disassembly strategies The selection of the companies was not random but rather took into consideration their potential for providing theoretical insights The study starts by outlining a new process model of disassembly for remanufacturing followed by a comprehensive identification of factors affecting disassembly It incorporates organisational characteristics process choices and product attributes The five companies are then grouped into four quadrants according to these factors and the strategies within each group are analysed in order to develop the framework of the disassembly strategies which is the main contribution of this study The key findings of this research are 1 remanufacturers in Quadrant I which disassemble cores with low complexity and high stability supply rely on disassembly resources flexibility 2 remanufacturers located in Quadrant II which disassemble cores with low product complexity and high stability supply attempt to exploit the benefits of high volume of production and 3 remanufacturers in Quadrant III which disassemble complex cores in high stability supply endeavour to maximise recovered value from the cores No company was classified as belonging in Quadrant IV which disassemble cores with high complexity but lack of stability The generalisability of the framework has been confirmed by a panel of experts The members of the expert panel are academia and practitioners that have an extensive knowledge in this field This study could be criticised on the basis of its small sample size however the validity and reliability criteria are fulfilled to ensure that the results represent its objectivity **automatic disassembly and total ordering in three dimensions** tony c. woo, **Automatic Selective Disassembly Time Computation and Product Architecture Redesign Suggestion** Yang Hu,Washington State University.
