## **Brain Tumors Contemporary Cancer Research:**

Brain Tumors Francis Ali-Osman,2007-10-28 Exciting new developments and discoveries of the last two decades are beginning to shed light on the complex biology of brain tumors and are advancing our understanding of the cellular and molecular processes involved in their initiation progression and clinical and biological behavior. The disease process in brain tumors is quite complex and the resulting tumors are characterized by a high degree of biological and clinical diversity. Thus despite the advances of the last two decades prognosis for patients with malignant brain tumors remains abysmal. Significant progress in the diagnosis treatment and ultimately prevention of these tumors will require both the timely harnessing of the advances in basic and clinical brain tumor research and a continuing concerted effort at increasing our understanding of brain tumor biology in particular the molecular genetic changes and perturbations of cellular pathways involved in brain oncogenesis and which drive the biological and clinical behavior of the tumors. Brain tumor diagnosis and prognosis which is still largely based on histopathology and other clinical criteria will in the future acquire a significant molecular component with the incorporation of knowledge of genes that are mutated over expressed deleted silenced or functionally altered in the tumors. Treatment strategies for brain tumors rather than being empirical will be rationally developed based on an understanding of the cellular and molecular mechanisms and targets that have been activated suppressed or otherwise altered.

Omerhodzic, Kenan Arnautovic, 2019-01-16 The past three decades have been marked with huge enthusiasm from scientists and professionals in an effort to find a cure for glioma disease Methods to confirm the kinds and grades of glioma have taken a path from classical macro to microscopic pathohystological confirmation of tumors through morphological histological molecular and genetic diagnosis Surgically progress was made possible with the development and use of technological aids for example neuronavigation cortical mapping electrocorticography neuromonitoring functional and intraoperative MRI magnetoencephalography etc Great hope was placed on the extension of tumor resection and popular supratotal resection Significant progress has been made generally in glioma treatment with the use of modern radiotherapy and new chemotherapeutics What do we want to see for the future By way of stem cells a specific medicine will be produced individualized for the particular patient and by using a microcapsule it will be implanted into the brain zone affected by the tumor by way of robot surgery and injection needle This is not at all an unrealistic expectation in the next decade or two
