Evolving Fuzzy Systems - Methodologies, Advanced Concepts and Applications Edwin Lughofer,2011-01-19 In today s real world applications there is an increasing demand of integrating new information and knowledge on demand into model building processes to account for changing system dynamics new operating conditions varying human behaviors or environmental influences Evolving fuzzy systems EFS are a powerful tool to cope with this requirement as they are able to automatically adapt parameters expand their structure and extend their memory on the fly allowing on line real time modeling This book comprises several evolving fuzzy systems approaches which have emerged during the last decade and highlights the most important incremental learning methods used The second part is dedicated to advanced concepts for increasing performance robustness process safety and reliability for enhancing user friendliness and enlarging the field of applicability of EFS and for improving the interpretability and understandability of the evolved models The third part underlines the usefulness and necessity of evolving fuzzy systems in several online real world application scenarios provides an outline of potential future applications and raises open problems and new challenges for the next generation evolving systems including human inspired evolving machines The book includes basic principles concepts algorithms and theoretic results underlined by illustrations It is dedicated to researchers from the field of fuzzy systems machine learning data mining and system identification as well as engineers and technicians who apply data driven modeling techniques in real world

systems **Nonlinear Predictive Control Using Wiener Models** Maciej Ławryńczuk,2021-09-21 This book presents computationally efficient MPC solutions The classical model predictive control MPC approach to control dynamical systems described by the Wiener model uses an inverse static block to cancel the influence of process nonlinearity Unfortunately the model s structure is limited and it gives poor control quality in the case of an imperfect model and disturbances An alternative is to use the computationally demanding MPC scheme with on line nonlinear optimisation repeated at each sampling instant A linear approximation of the Wiener model or the predicted trajectory is found on line As a result quadratic optimisation tasks are obtained Furthermore parameterisation using Laguerre functions is possible to reduce the number of decision variables Simulation results for ten benchmark processes show that the discussed MPC algorithms lead to excellent control quality For a neutralisation reactor and a fuel cell essential advantages of neural Wiener models are demonstrated
