Advanced Reinforced Concrete Design, (inkl. E-Book als PDF) Georgios Gaganelis, Patrick Forman, Peter Mark, 2022-07-18 Concrete is the most used building material. Its main component cement however accounts for up to 10 % of global CO₂ emissions and is therefore a major contributor to human induced climate change. Due to its low tensile strength concrete must be further enhanced in tension with adequate reinforcement such as steel. Producing the latter therefore additionally impacts the environment. Consequently reducing the material amount for design and construction of structures thus lowering material and transport induced emissions represents a key element to climate protection. In this context meeting the essential requirements sustainability, serviceability, durability is yet indispensable. The book presents innovative optimization aided design methods for concrete structures. Mathematical optimization is applied to practical problems of structural concrete at each level from external through internal structure identification to cross section design. It is shown how to design resource efficient structures following the flux of forces, how to optimally adapt reinforcement layouts to the internal force flow and how to efficiently cope with demanding cross sectional design tasks such as biaxial bending. The optimization aided design methods are discussed in detail and described vividly. They are independent of standards concrete material normal to ultra high performance and reinforcement type steel fibers to carbon bars thus universally applicable. The book illustrates the different approaches with numerous figures and calculation examples. Existing applications in structural engineering are presented to demonstrate the potential of optimization aided design concepts including ultra lightweight hybrid beams, thin concrete solar collectors and improved reinforcement layouts for tunnel lining segments. incl ebook as PDF [Modeling and Testing of Reinforced Concrete Or Composite Structures Using Advanced New Materials](#) Ayman El-Zohairy, 2024-01-09 This Reprint focuses on the emerging concepts that allow for the design of reinforced concrete including new or improved concrete material as well as on the characterization of the properties of typical reinforced concrete structures. The author of this Reprint is an Assistant Professor at Texas A M University Commerce USA. **Advanced Materials Development & Performance** Yun Hae Kim, 2015-06-16 Selected peer reviewed papers from the 2014 7th International Conference on Advanced Materials Development Performance AMDP 2014 July 17 20 2014 Busan Korea. **REPAIR AND REHABILITATION OF CONCRETE STRUCTURES** MODI, POONAM I., PATEL, CHIRAG N., 2015-12-01 The field of Concrete Repair and Rehabilitation is gaining importance in view of its positive impacts in terms of socio economic benefits and environmental sustainability. Due to growing importance of this field many engineering colleges have included the subject of concrete repair and rehabilitation in the senior undergraduate and postgraduate course curriculums of civil engineering. This book is an earnest attempt to help students of civil engineering in enhancing their

understanding and awareness about critical elements of repair and rehabilitation of concrete structure The content is organised in such a way that it fulfils the academic needs of the students This text attempts to dovetail all important aspects such as causes of distress assessment and evaluation of deterioration techniques for repair and rehabilitation along with selection of repair and rehabilitation materials and other important aspects related to preventive maintenance and rehabilitation structural safety measures The primary objective of this textbook is to guide students to Understand the underlying causes and types of deterioration in concrete structure Learn about the field and laboratory testing methods available to evaluate the level of deterioration Get well acquainted with options of repair materials and techniques available to address different types of distress in concrete structure Grasp the knowledge of available techniques and their application for strengthening existing structural systems Advanced Polymer Composites and Polymers in the Civil Infrastructure L.C. Hollaway,2001-07-12 In recent years the fabrication technologies for the production of advanced polymer composites have been revolutionised by sophisticated manufacturing techniques These methods have enabled polymer composite materials to produce good quality laminates with minimal voids and accurate fibre alignment This book familiarises and provides a background to the understanding and use of advanced polymer composites in the civil infrastructure numerous examples have been provided to illustrate the use and versatility of the material Furthermore the book discusses the current fabrication techniques design methods and formulae for the design of structural composite systems In addition it discusses the fundamentals of geosynthetics used in geotechnical engineering The book introduces the fibres and matrices that are used to manufacture composites their mechanical and in service properties and their long term loading characteristics all these properties are specifically associated with the construction industry The chapters then discuss the design aspects for all composite units as well as systems used for the renewal of civil infrastructure Finally the book demonstrated the unique possibilities of combining composites with conventional materials to form units in which the various materials making up the unit are loaded in the mode that specifically suits their mechanical characteristics
