**Dynamic Asset Pricing Theory** Darrell Duffie,2010-01-27 This is a thoroughly updated edition of Dynamic Asset Pricing Theory the standard text for doctoral students and researchers on the theory of asset pricing and portfolio selection in multiperiod settings under uncertainty The asset pricing results are based on the three increasingly restrictive assumptions absence of arbitrage single agent optimality and equilibrium These results are unified with two key concepts state prices and martingales Technicalities are given relatively little emphasis so as to draw connections between these concepts and to make plain the similarities between discrete and continuous time models Readers will be particularly intrigued by this latest edition s most significant new feature a chapter on corporate securities

that offers alternative approaches to the valuation of corporate debt Also while much of the continuous time portion of the theory is based on Brownian motion this third edition introduces jumps for example those associated with Poisson arrivals in order to accommodate surprise events such as bond defaults Applications include term structure models derivative valuation and hedging methods Numerical methods covered include Monte Carlo simulation and finite difference solutions for partial differential equations Each chapter provides extensive problem exercises and notes to the literature A system of appendixes reviews the necessary mathematical concepts And references have been updated throughout With this new edition Dynamic Asset Pricing Theory remains at the head of the field

### **Computational Methods for the Study of Dynamic Economies**

Ramon Marimon,Andrew Scott,1999-03-04 Macroeconomics increasingly uses stochastic dynamic general equilibrium models to understand theoretical and policy issues Unless very strong assumptions are made understanding the properties of particular models requires solving the model using a computer This volume brings together leading contributors in the field who explain in detail how to implement the computational techniques needed to solve dynamic economics models A broad spread of techniques are covered and their application in a wide range of subjects discussed The book provides the basics of a toolkit which researchers and graduate students can use to solve and analyse their own theoretical models

### **Asset Prices, Booms and Recessions**

Willi Semmler,2011-06-15 The financial market melt down of the years 2007 2009 has posed great challenges for studies on financial economics This financial economics text focuses on the dynamic interaction of financial markets and economic activity The financial market to be studied here encompasses the money and bond market credit market stock market and foreign exchange market economic activity includes the actions and interactions of firms banks households governments and countries The book shows how economic activity affects asset prices and the financial market and how asset prices and financial market volatility and crises impact economic activity The book offers extensive coverage of new and advanced topics in financial economics such as the term structure of interest rates credit derivatives and credit risk domestic and international portfolio theory multi agent and evolutionary approaches capital asset pricing beyond consumption based models and dynamic portfolio decisions Moreover a completely new section of the book is dedicated to the recent financial market meltdown of the years 2007 2009 Emphasis is placed on empirical evidence relating to episodes of financial instability and financial crises in the U S and in Latin American Asian and Euro area countries Overall the book explains what researchers and practitioners in the financial sector need to know about the financial real interaction and what practitioners and policy makers need to know about the financial market

*Computing Stochastic Dynamic Economic Models with a Large Number of State Variables*

Benjamin Malin,2007 We describe a sparse grid collocation algorithm to compute recursive solutions of dynamic economies with a sizable number of state variables We show how powerful this method may be in applications by computing the nonlinear recursive solution of an international real business cycle model with a substantial number of countries complete insurance markets and frictions that impede frictionless international capital flows In this economy the aggregate state vector includes the distribution of world capital across different countries as well as the exogenous country specific technology shocks We use the algorithm to efficiently solve models with 2 4 and 6 countries i e up to 12 continuous state variables
