Eric Gershwin, Georges M. Halpern, 2012-12-06 Although the mechanisms and triggers that stimulate and are responsible for the natural history of asthma are steadily being more clearly defined uncertainties still surround both the genetic basis and the etiology of one of the most common syndromes in the world In fact it is of considerable concern and interest that the incidence of asthma today appears to be rising These statistical increments may only reflect an increasing awareness of the disease or its earlier and more sophisticated diagnosis More important however asthma mortality appears to be increasing This increase has occurred despite the continuing expansion of a diagnostic and management information base and the development of novel and ever more effective therapeutic modalities Several explanations have been offered for this increase in mortality including that it may result from a statistical artifact based on a change in the coding criteria for asthma from the International Classification of Diseases Version 8 ICD 8 to ICD 9 worsened pollution delays in seeking medical help behavioral changes deficits in the asthma education of both patients and primary care providers toxicity of beta agonists and noncompliance with instructions for the proper use of medications It should also be emphasized that the increases in both incidence and mortality may be a reflection of accumulating body burdens of environmental toxicants and of increased oxidative damage There has clearly been a degradation of environmental quality And although considerable attention has been

focused on this possibility in both the scientific and lay press more research in this area is definitely needed

development of new treatments especially in the case of coexistent lung diseases with other inflammatory diseases Great progress has been made in recent years in many areas of the field particularly in understanding the molecular geneses regulatory mechanisms signalling pathways and cellular processes within lung disease as well as basic and clinical technology drug discovery diagnoses treatment options and predictive prognoses This is the first text to aggregate these developments In two comprehensive volumes experts from all over the world present state of the art advances in the study of lung inflammation in health and disease Contributing authors cover well known as well as emerging topics in basic translational and clinical research with the aim of providing researchers clinicians professionals and students with new perspectives and concepts The editors hope these books will also help to direct future research in lung disease and other inflammatory diseases and result in the development of novel therapeutics Asthma, Physiology, Immunopharmacology, and Treatment Lawrence M.
