Karin Nielsen-Saines

Ashrae District Cooling Practice Guide:

District Cooling Alaa A. Olama, 2016-11-03 DISTRICT COOLING THEORY and PRACTICE provides a unique study of an energy cogeneration system set up to bring chilled water to buildings offices apartment houses and factories needing cooling for air conditioning and refrigeration In winter the source for the cooling can often be sea water so it is a cheaper resource than using electricity to run compressors for cooling The related technology of District Heating has been an established engineering practice for many years but District Cooling is a relatively new technology now being implemented in various parts of the world including the USA Arab Emirates and Kuwait and Saudi Arabia Existing books in the area are scarce and do not address many of the crucial issues facing nations with high overall air temperatures many of which are developing District Cooling plans using sea water DISTRICT COOLING THEORY PRACTICE integrates the theory behind district cooling planning with the practical engineering approaches so it can serve the policy makers engineers and planners whose efforts have to be coordinated and closely managed to make such systems effective and affordable In times of rising worldwide temperatures District Cooling is a way to provide needed cooling with energy conservation and sustainability This book will be the most up to date and comprehensive study on the subject with Case Studies describing real projects in detail

District Heating and Cooling Networks Antonio Colmenar Santos, David Borge Diez, Enrique Rosales Asensio, 2020-05-12 Conventional thermal power generating plants reject a large amount of energy every year If this rejected heat were to be used through district heating networks given prior energy valorisation there would be a noticeable decrease in the amount of fossil fuels imported for heating As a consequence benefits would be experienced in the form of an increase in energy efficiency an improvement in energy security and a minimisation of emitted greenhouse gases Given that heat demand is not expected to decrease significantly in the medium term district heating networks show the greatest potential for the development of cogeneration Due to their cost competitiveness flexibility in terms of the ability to use renewable energy resources such as geothermal or solar thermal and fossil fuels more specifically the residual heat from combustion and the fact that in some cases losses to a country region s energy balance can be easily integrated into district heating networks which would not be the case in a fully electric future district heating and cooling networks and cogeneration could become a key element for a future with greater energy security while being more sustainable if appropriate measures were implemented This book therefore seeks to propose an energy strategy for a number of cities regions countries by proposing appropriate measures supported by detailed case studies *District Cooling Best Practice Guide* ,2008 **ASHRAE**
