Assessing And Improving Prediction And Classification:

Assessing and Improving Prediction and Classification Timothy Masters, 2017-12-20 Assess the quality of your prediction and classification models in ways that accurately reflect their real world performance and then improve this performance using state of the art algorithms such as committee based decision making resampling the dataset and boosting. This book presents many important techniques for building powerful robust models and quantifying their expected behavior when put to work in your application. Considerable attention is given to information theory especially as it relates to discovering and exploiting relationships between variables employed by your models. This presentation of an often confusing subject avoids advanced mathematics focusing instead on concepts easily understood by those with modest background in mathematics. All algorithms include an intuitive explanation of operation essential equations references to more rigorous theory and commented C source code. Many of these techniques are recent developments still not in widespread use. Others are standard algorithms given a fresh look. In every case the emphasis is on practical applicability with all code written in such a way that it can easily be included in any program. What You'll Learn Compute entropy to detect problematic predictors. Improve numeric predictions using constrained and unconstrained combinations variance weighted interpolation and kernel regression smoothing. Carry out classification decisions using Borda counts MinMax and MaxMin rules union and intersection rules logistic regression selection by local accuracy maximization of the fuzzy integral and pairwise coupling. Harness information theoretic techniques to rapidly screen large numbers of candidate predictors identifying those that are especially promising. Use Monte Carlo permutation methods to assess the role of good luck in performance results. Compute confidence and tolerance intervals for predictions as well as confidence levels for classification decisions. Who This Book is For Anyone who creates prediction or classification models will find a wealth of useful algorithms in this book. Although all code examples are written in C the algorithms are described in sufficient detail that they can easily be programmed in any language.

Assessing and Improving Prediction and Classification Timothy Masters, 2013-04-21 This book begins by presenting methods for performing practical real life assessment of the performance of prediction and classification models. It then goes on to discuss techniques for improving the performance of such models by intelligent resampling of training testing data combining multiple models into sophisticated committees and making use of exogenous information to dynamically choose modeling methodologies. Rigorous statistical techniques for computing confidence in predictions and decisions receive extensive treatment. Finally a hundred pages are devoted to the use of information theory in evaluating and selecting useful predictors. Special attention is paid to Schreiber's Information Transfer a recent generalization of Grainger Causality. Well commented C code is given for every algorithm and technique. The ultimate purpose of this text is three fold. The first goal is to open the eyes of serious developers to some of the hidden pitfalls that lurk in the model development process. The second is to provide broad exposure for some of the most powerful model enhancement algorithms that have emerged from

academia in the last two decades while not bogging down readers in cryptic mathematical theory Finally this text should provide the reader with a toolbox of ready to use C code that can be easily incorporated into his or her existing programs
