

# Standard Test Method for Measuring Humidity with a Psychrometer (the Measurement of Wet- and Dry-Bulb Temperatures)<sup>1</sup>

This standard is issued under the standard designation E2227; the number immediately following the designation indicates the year of original approval or the year of revision. The year of last revision is shown in parentheses. A number in parentheses indicates the year of withdrawal, if applicable. Reading this standard is subject to certain changes that are part of the standard as prepared.

## 1. Scope

### 1.1 General

1.1.1 This test method covers the determination of the humidity of atmospheres up to masses of wet- and dry-bulb temperature readings.

1.1.2 This test method is applicable for meteorological measurements at the earth's surface, for the purpose of the testing of materials, and for the determination of the relative humidity of moist standard atmospheres and test atmospheres.

1.1.3 This test method is also applicable where the temperature, wet- and dry-bulb only is required. In this case, the instrument comprises a wet-bulb thermometer only.

1.1.4 Relative humidity (RH) does not denote a unit. Uncertainty in the relative humidity are expressed in the form  $RH \pm \text{in } \%$ , which means that the relative humidity is expected to lie in the range  $(RH - \text{in } \%)$  to  $(RH + \text{in } \%)$ , where  $RH$  is the observed relative humidity. RH measurements are at the 95% confidence level.

### 1.2 Method A—Psychrometer Measured by Aspiration

1.2.1 This method incorporates the psychrometer equipped by aspiration. The aspirated psychrometer is more accurate than the sling (wetting) psychrometer (see Method B), and it offers advantages as regards to the space which is required, the possibility of using alternative types of thermometers (for example, electrically, under shielding of thermometers under three pressure methods, shielded housings, and immersion).

1.2.2 This method is applicable within the ambient temperature range 0 to 50°C, wet-bulb temperatures not lower than 1°C, and restricted to ambient pressures not differing from standard pressure by more than 70 %.

### 1.3 Method B—Psychrometer Measured by Wetting (Sling Psychrometer)

1.3.1 This method incorporates the psychrometer equipped by wetting (sling psychrometer).

1.3.2 This method is applicable within the ambient temperature range 0 to 50°C, wet-bulb temperatures not lower than 1°C, and restricted to ambient pressures not differing from standard pressure by more than 70 %.

1.3.3 The values stated in SI units are to be regarded as standard. The values given in parentheses are included in this standard.

1.3.4 **Warning**—Moisture has been identified by many investigators as one of the factors essential for rapid cancer growth and metastasis. Moisture, or the support from which it is derived, is essential to health and continues to be essential. It cannot always be removed without harmful effects on many cells, including parasites. For the aspirated psychrometer (Sling, Glass, Glass, Glass, etc.) for additional information. There is also the danger that cooling moisture under pressure (including pressure) may cause or create injury to personnel in the lab.

1.3.5 This standard does not purport to address all of the safety concerns of any particular activity. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use. (See [www.astm.org](#) for specific safety precautions, see [D18](#) and [D19](#).)
