

Ultrasound scanning of fetal anomaly

Lung sequestration diagnosed on ultrasound at 20 weeks of gestation. e=echogenic lung, v=vessel arising from aorta.

The role of ultrasound has evolved, especially in countries where a routine first trimester scan has been introduced. The National Institute of Clinical Excellence (NICE) has recommended that all pregnant women be offered two scans in pregnancy – the first at 11–13 weeks of gestation and the second between 18+0 and 20+6 weeks of gestation.

The purpose of the first trimester scan is to:

- establish gestational age
- detect multiple pregnancy and chorionicity
- measure fetal nuchal translucency as part of the combined test for the detection of Down syndrome
- detect fetal structural abnormalities

The main focus of the second trimester scan is the identification of fetal structural malformations. It also plays an important role in fetal biometry, liquor volume assessment and placental assessment. The majority of women have a normal result and are reassured by this. A small proportion of women will have an abnormal result, and will turn to their obstetrician to provide them with further information.

This tutorial will help you to learn more about the fetal anomaly scan as a screening test, and the management of some of the abnormalities that may be detected.

Manual of Diagnostic Ultrasound World Health Organization, 2011. Forlagets beskrivelse: The World Health Organization (WHO) recognizes ultrasound as an important medical diagnostic imaging technology. Manuals on ultrasound have been published by WHO since 2001 with the purpose of guiding health professionals on the safe and effective use of ultrasound. Among the diagnostic imaging technologies, ultrasound is the safer and least expensive, and technological advances are making it more user-friendly and portable. Ultrasound has many uses, both diagnostic and therapeutic. For the purposes of this manual, only diagnostic ultrasound will be considered and further analysed. Basic physics of ultrasonographic imaging was released in 2005; since then, WHO has addressed the physics, safe use, and different applications of ultrasound as an important diagnostic imaging tool. Since it is a non-ionizing radiation technology along with nuclear magnetic resonance imaging, the risks inherent to its use are lower than those presented by other diagnostic imaging technologies using ionizing radiation, such as the radiological technologies X-rays and computed tomography scanners.
