Background: Cellular cells, including plants, fungi, and animals, all use DNA to store genetic information. DNA is a long, double-stranded molecule that contains the instructions for building proteins. Proteins are the molecules that do the work of the cell. They are made of amino acids, which are linked together in a chain. The sequence of amino acids in a protein determines its function.

Student Exploration

Cells use a process called **transcription** to make RNA. RNA is a single-stranded molecule that contains the instructions for building proteins. RNA is made of nucleotides, which are linked together in a chain. The sequence of nucleotides in an RNA molecule determines its function. RNA is used to make proteins in a process called **translation**.

1. What is the difference between DNA and RNA? (Hint: Think about the structure of each molecule, the sugar in the backbone, and the bases.)

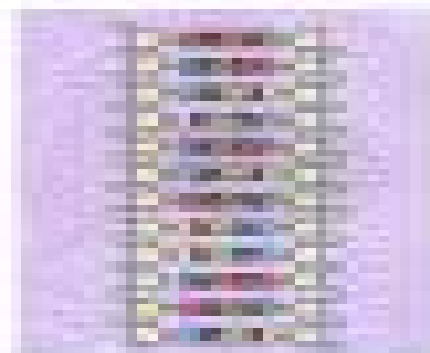

Answer: DNA is a double-stranded molecule, while RNA is a single-stranded molecule. DNA has a sugar-phosphate backbone, while RNA has a sugar-phosphate backbone. DNA has the bases A, T, C, and G, while RNA has the bases A, U, C, and G.

Question: What is the difference between a gene and a protein?

Answer:

2. **Transcription** is a type of synthesis. Synthesis is the process of making something. What is the difference between transcription and translation?

Answer: Transcription is the process of making RNA from a DNA template. Translation is the process of making a protein from an RNA template.
