Advances In Fluvial Dynamics And Stratigraphy:

Advances in Fluvial Dynamics and Stratigraphy Paul A. Carling, Martin R. Dawson, 1996-08-06 A final chapter provides a brief view of future perspectives **General Technical Report RMRS**, 1998 *From Depositional Systems to Sedimentary Successions on the Norwegian Continental Margin* Allard W. Martinius, R. Ravnås, J. A. Howell, R. J. Steel, J. P. Wonham, 2014-07-18 The Norwegian Continental Shelf NCS focus of this special publication is a prolific hydrocarbon region and both exploration and production activity remains high to this day with a positive production outlook A key element today and in the future is to couple technological developments to improving our understanding of specific geological situations The theme of the publication reflects the immense efforts made by all industry operators and their academic partners on the NCS to understand in detail the structural setting sedimentology and stratigraphy of the hydrocarbon bearing units and their source and seal The papers cover a wide spectrum of depositional environments ranging from alluvial fans to deepwater fans in almost every climate type from arid through humid to glacial and in a variety of tectonic settings Special attention is given to the integration of both analogue studies and process based models with the insights gained from extensive subsurface datasets Sediment-Body Geometry and Heterogeneity A.W. Martinius, J.A. Howell, T. Good, 2014-07-28 Over the past 20 years there has been a major growth in efforts to quantify the geometry and dimensions of sediment bodies from analogues to provide quantitative input to geological models The aim of this volume is to examine the current state of the art from both an industry and an academic perspective Contributions discuss the challenges of extracting relevant data from different types of sedimentary analogue outcrop process models seismic and the application and significance of such information for improving predictions from subsurface static and dynamic models Special attention is given to modelling reservoir properties and gridding issues for predicting subsurface fluid flow As such the volume is expected to be of interest to both the geoscience community concerned with the fundamentals of sedimentary architecture as well as geological modellers and engineers interested in how these characteristics are modelled and influence subsurface predictions **Analogue and Numerical Modelling of Sedimentary Systems** Poppe de Boer, George Postma, Kees van der Zwan, Peter Burgess, Peter Kukla, 2009-01-26 Understanding basin fill evolution and the origin of stratal architectures has traditionally been based on studies of outcrops well and seismic data studies of and inferences on qualitative geological processes and to a lesser extent based on quantitative observations of modern and ancient sedimentary environments Insight gained on the basis of these studies can increasingly be tested and extended through the application of numerical and analogue forward models Present day stratigraphic forward modelling follows two principle lines 1 the deterministic process based approach ideally with resolution of the fundamental equations of fluid and sediment motion at all scales and 2 the stochastic approach The process based approach leads to improved understanding of the dynamics physics of the system increasing our predictive power of how systems evolve under various forcing conditions unless the system is highly non linear and hence difficult or perhaps

even impossible to predict The stochastic approach is more direct relatively simple and useful for study of more complicated or less well understood systems Process based models more than stochastic ones are directly limited by the diversity of temporal and spatial scales and the very incomplete knowledge of how processes operate and interact on the various scales The papers included in this book demonstrate how cross fertilization between traditional field studies and analogue and numerical forward modelling expands our understanding of Earth surface systems

Sampling Surface and Subsurface Particle-size Distributions in Wadable Gravel- and Cobble-bed Streams for Analyses in Sediment Transport, Hydraulics, and Streambed Monitoring Kristin Bunte, Steven R. Abt, 2001 This document provides guidance for sampling surface and subsurface sediment from wadable gravel and cobble bed streams After a short introduction to streams types and classifications in gravel bed rivers the document explains the field and laboratory measurement of particle sizes and the statistical analysis of particle size distributions Analysis of particle parameters including shape density and bulk density are also discussed The document describes the spatial variability of bed material particle sizes as well as the horizontal and vertical structure of particle deposits The discussion of sampling procedures and equipment helps the user to make appropriate selections that support the sampling objective Sample size estimates may be obtained from empirical data or computed from statistical relationships between sample size and accuracy The document explains a variety of methods their usage and prerequisites A detailed discussion of sampling schemes guides the user to select appropriate spatial sampling patterns necessary to produce representative samples

Sedimentology James L. Best, C. R. Fielding, Ian Jarvis, Peter Mozley, 2009-05-11 Sedimentology has seen many significant advances and changes over the past 40 years ranging from facies modelling to sequence stratigraphy chemostratigraphy to basin analysis and the integration of studies of physical chemical and increasingly biological processes in the interpretation and prediction of sedimentary environments and products The subject is becoming ever more interdisciplinary and applied and now has far more links to other physical sciences Research and debate are continuing afresh as we move into this new interdisciplinary phase and promise many developments and increased uses of our subject Now seemed a good time to publish a series of review papers concerning some key current areas of research We hope that these papers will provide comprehensive starting points for those wishing to become acquainted with an area act as stimuli for debate and provide awareness and ideas for future research avenues No issue of this sort can of course ever be truly comprehensive in its coverage these reviews concern only selected snippets from the wide scope of sedimentology and each has of necessity been selective in its own area

Seismic Geomorphology R. J. Davies, 2007 We are poised to embark on a new era of discovery in the study of geomorphology The discipline has a long and illustrious history but in recent years an entirely new way of

studying landscapes and seascapes has been developed. It involves the use of 3D seismic data. Just as CAT scans allow medical staff to view our anatomy in 3D, seismic data now allows Earth scientists to do what the early geomorphologists could only dream of: view tens and hundreds of square kilometres of the Earth's subsurface in 3D and therefore see for the first time how landscapes have evolved through time. This volume demonstrates how Earth scientists are starting to use this relatively new tool to study the dynamic evolution of a range of sedimentary environments.

The Description & Analysis of Quaternary Stratigraphic Field Sections Maurice E. Tucker, 1999 *River, Coastal and Estuarine Morphodynamics: RCEM 2007, Two Volume Set* C. Marjolein Dohmen-Janssen, Suzanne J.M.H. Hulscher, 2007-09-06 This book brings together contributions from some 200 scientists from more than 20 countries who present and discuss the latest scientific research developments on this topic. It is organized around the general themes of relations between scales and long term morphodynamics such as biogeomorphology, small scale processes and grain sorting, morphodynamic free behavior, human interferences in morphodynamics. The book provides an excellent overview of the state of the art knowledge on River Coastal and Estuarine Morphodynamics and will be of interest to academics, engineers, planners, national and local authorities and all those involved in managing river, estuarine and coastal habitats.
