A large, detailed illustration of a tuna fish swimming in the ocean. The tuna is the central focus, shown in profile, swimming towards the left. It has a sleek, elongated body with a dark blue-grey back and a lighter blue-grey belly. Its fins are visible, including the dorsal fin, pectoral fins, and pelvic fins. The background is a deep blue ocean with several smaller fish swimming in the distance.

Advances in Tuna Aquaculture: From Hatchery to Market Bruno Augusto Amato Borges,2023-12 Most of tuna aquaculture production still relies on the capture of juveniles caught in the wild as this volume explains Ranching fattening and farming all refer to this type of production and these terms are frequently used interchangeably Ranching and fattening on the other hand are distinct from farming in the real sense The short term activity of holding subadult or adult tuna mainly for the purpose of improving their condition and fat content thereby increasing their market value is more accurately described by the former two terms However substantial increases in biomass are frequently achieved as well Australia Mexico and many producers in the Mediterranean use this method The period of ranching or fattening varies from region to region but typically only takes a few months In the last ten years the use of such fattening methods has increased dramatically to the point where before being sold a significant portion of all blue fin tuna captured in many areas of the globe are stocked into cages to increase their size and fat ratio This practice may be considered a value added process despite the inherent issues of the operation they are fed sardines and similar forage fish that are ecologically critical because the primary value of the tuna stored in the cages rises significantly in what can be considered a more powerful and ecologically resourceful manner than would exist in nature
