9.2. everything is a file

A **directory** is a special kind of **file**, but it is still a (case sensitive!) **file**. Each terminal window (for example `/dev/pts/4`), any hard disk or partition (for example `/dev/sdb1`) and any process are all represented somewhere in the **file system** as a **file**. It will become clear throughout this course that everything on Linux is a **file**.

9.3. file

The **file** utility determines the file type. Linux does not use extensions to determine the file type. The command line does not care whether a file ends in `.txt` or `.pdf`. As a system administrator, you should use the **file** command to determine the file type. Here are some examples on a typical Linux system.

```

paul@lanka:~$ file pic03.png
pic03.png: PNG image data, 3840 x 1200, 8-bit/color RGBA, non-interlaced
paul@lanka:~$ file /etc/passwd
/etc/passwd: ASCII text
paul@lanka:~$ file HelloWorld.c
HelloWorld.c: ASCII C program text
  
```

The **file** command uses a magic file that contains patterns to recognise file types. The magic file is located in `/usr/share/file/magic`. Type `man 5 magic` for more information.

It is interesting to point out **file -s** for special files like those in `/dev` and `/proc`.

```

root@debian6-8 file /dev/sda
  
```
