

# Biological Control

Biological control, or biocontrol, refers to the use of natural organisms, like beneficial insects, mites, and micro-organisms (such as bacteria, fungi, viruses, and nematodes) to control pests.

PlantwisePlus advocates for lower-risk plant protection practices and products, including biocontrol, and supports farmers to implement these safer solutions to protect their crops and the environment.

Conservation practices that maintain or increase populations of existing beneficial agents, for example through providing shelter and more nectar plants.

The ongoing application of beneficial organisms to control pests, often using commercially available species.

The introduction of a non-native natural enemy to control an invasive pest. Once released, the agent will replicate, providing permanent control.

*Nematodes and the Biological Control of Insect Pests* RA Bedding, RJ Akhurst, HK Kaya, 1993-01-01 Environmental and public health problems arising from the use of chemical insecticides have led to an increasing demand for alternatives for insect pest control Together with this widespread public concern resulting in governmental bans on many of the most effective insecticides and development of insecticide resistance has severely reduced the range of useful insecticides available Alternative control measures such as the biological control of pest insects with parasitoids and predators and microbial biocides have been in field use for several decades Although these alternatives are being continually improved most insect pests are nonetheless still controlled with chemical insecticides This book presents the latest work on the biological control of insects using nematodes it covers a range of topics that will help provide a better understanding of the potential problems involved in developing these nematodes as biological control agents Nematodes infect hundreds of different species from most orders of insects and affect their insect hosts in a variety of ways
