Bat Evolution Ecology And Conservation:

Bat Evolution, Ecology, and Conservation Rick A. Adams, Scott C. Pedersen, 2013-09-05 Recent advances in the study of bats have changed the way we understand this illusive group of mammals. This volume consist of 25 chapters and 57 authors from around the globe all writing on the most recent finding on the evolution ecology and conservation of bats. The chapters in this book are not intended to be exhaustive literature reviews but instead extended manuscripts that bring new and fresh perspectives. Many chapters consist of previously unpublished data and are repetitive of new insights and understanding in bat evolution ecology and conservation. All chapters were peer reviewed and revised by the authors. Many of the chapters are multi authored to provide comprehensive and authoritative coverage of the topics. Island Bats Theodore H. Fleming, Paul A. Racey, 2010-03-15 The second largest order of mammals Chiroptera comprises more than one thousand species of bats. Because of their mobility bats are often the only native mammals on isolated oceanic islands where more than half of all bat species live. These island bats represent an evolutionarily distinctive and ecologically significant part of the earth's biological diversity. Island Bats is the first book to focus solely on the evolution ecology and conservation of bats living in the world's island ecosystems. Among other topics the contributors to this volume examine how the earth's history has affected the evolution of island bats, investigate how bat populations are affected by volcanic eruptions and hurricanes, and explore the threat of extinction from human disturbance. Geographically diverse the volume includes studies of the islands of the Caribbean, the Western Indian Ocean, Micronesia, Indonesia, the Philippines, and New Zealand. With its wealth of information from long term studies Island Bats provides timely and valuable information about how this fauna has evolved and how it can be conserved.

Bats John D. Altringham, 2011-08-25 Bats are highly charismatic and popular animals that are not only fascinating in their own right but illustrate most of the topical and important concepts and issues in mammalian biology. This book covers the key aspects of bat biology including evolution, flight, echolocation, hibernation, reproduction, feeding and roosting ecology, social behaviour, migration, population and community ecology, biogeography and conservation. This new edition is fully updated and greatly expanded throughout, maintaining the depth and scientific rigour of the first edition. It is written with infectious enthusiasm and beautifully illustrated with drawings and colour photographs.

Bat Ecology Thomas H. Kunz, M. Brock Fenton, 2003-04-15 In recent years researchers have discovered that bats play key roles in many ecosystems as insect predators, seed dispersers and pollinators. Bats also display astonishing ecological and evolutionary diversity and serve as important models for studies of a wide variety of topics including food webs, biogeography and emerging diseases. In Bat Ecology, world renowned bat scholars present an up to date comprehensive and authoritative review of this ongoing research. The first part of the book covers the life history and behavioral ecology of bats from migration to sperm competition and natural selection. The next section focuses on functional ecology including ecomorphology, feeding and physiology. In the third section contributors explore macroecological issues such as the evolution

of ecological diversity range size and infectious diseases including rabies in bats A final chapter discusses conservation challenges facing these fascinating flying mammals Bat Ecology is the most comprehensive state of the field collection for scientists and researchers Contributors John D Altringham Robert M R Barclay Tenley M Conway Elizabeth R Dumont Peggy Eby Abigail C Entwistle Theodore H Fleming Patricia W Freeman Lawrence D Harder Gareth Jones Linda F Lumsden Gary F McCracken Sharon L Messenger Bruce D Patterson Paul A Racey Jens Rydell Charles E Rupprecht Nancy B Simmons Jean S Smith John R Speakman Richard D Stevens Elizabeth F Stockwell Sharon M Swartz Donald W Thomas Otto von Helversen Gerald S Wilkinson Michael R Willig York Winter **50 Years of Bat Research** Burton K. Lim, M. Brock Fenton, R. Mark Brigham, Shahroukh Mistry, Allen Kurta, Erin H. Gillam, Amy Russell, Jorge Ortega, 2021-01-23 With more than 1 400 species bats are an incredibly diverse and successful group of mammals that can serve as model systems for many unique evolutionary adaptations Flight has allowed them to master the sky while echolocation enables them to navigate in the dark Being small secretive nocturnal creatures has made bats a challenge to study but over the past 50 years innovative research has made it possible to dispel some of the mystery and myth surrounding them to give us a better understanding of the role these animals play in the ecosystem The structure of the book is based on several broad themes across the biological sciences including the evolution of bats their ecology and behavior and conservation of biodiversity Within these themes are more specific topics on important aspects of bat research such as morphology molecular biology echolocation taxonomy systematics threats to bats social structure reproduction movements and feeding strategies Given its scope the book will appeal to the wider scientific community environmental organizations and government policymakers who are interested in the interdisciplinary aspects of biology and nature *Bat Conservation* Anna Berthinussen, Olivia C. Richardson, John D. Altringham, 2014-05-16 This book brings together scientific evidence and experience relevant to the practical conservation of bats The authors worked with an international group of bat experts and conservationists to develop a global list of interventions that could benefit bats For each intervention the book summarises studies captured by the Conservation Evidence project where that intervention has been tested and its effects on bats quantified The result is a thorough guide to what is known or not known about the effectiveness of bat conservation actions throughout the world Bat Conservation is the fifth in a series of Synopses that will cover different species groups and habitats gradually building into a comprehensive summary of evidence on the effects of conservation interventions for all biodiversity throughout the world By making evidence accessible in this way we hope to enable a change in the practice of conservation so it can become more evidence based We also aim to highlight where there are gaps in knowledge Evidence from all around the world is included If there appears to be a bias towards evidence from northern European or North American temperate environments this reflects a current bias in the published research that is available to us Conservation interventions are grouped primarily according to the relevant direct threats as defined in the International Union for the Conservation of Nature IUCN's Unified Classification
