Microeconomics, Fourth Edition and Study Guide Boyes, 1999     Biomateromics Steven W. Cranford, Markus J. Buehler, 2012-05-23 Biomateromics is the holistic study of biological material systems. While such systems are undoubtedly complex we frequently encounter similar components, universal building blocks and hierarchical structure motifs which result in a diverse set of functionalities. Similar to the way music or language arises from a limited set of music notes and words we exploit the relationships between form and function in a meaningful way by recognizing the similarities between Beethoven and bone or Shakespeare and silk. Through the investigation of material properties examining fundamental links between processes, structures and properties at multiple scales and their interactions, materomics explains system functionality from the level of building blocks. Biomateromics specifically focuses the analysis of the role of materials in the context of biological processes, the transfer of biological material principles towards biomimetic and bioinspired applications and the study of interfaces between living and non living systems. The challenges of biological materials are vast but the convergence of biology, mathematics and engineering as well as computational and experimental techniques have resulted in the toolset necessary to describe complex material systems from nano to macro. Applying biomateromics can unlock Nature's secret to high performance materials such as spider silk, bone and nacre and elucidate the progression and diagnosis of diseases. Similarly it contributes to develop a *de novo* understanding of biological material processes and to the potential of exploiting novel concepts in innovation material synthesis and design.
