

Abhinav Muthoo, *Bargaining theory with applications*. Cambridge and New York: Cambridge University Press, 1999. xv + 357 pages. \$24.95 (paper).

Abhinav Muthoo skillfully synthesizes the literature on non-cooperative bargaining theory that was initiated by Rubinstein's (1982) seminal analysis of the alternating-offers bargaining game and relates it to the well-known Nash bargaining solution. The book also contains new results, in particular regarding the relative impacts of several forces that influence the bargaining outcome. Moreover, Muthoo presents many interesting applications of the theory, including issues such as optimal asset ownership, bribery and the control of crime, corruption in tax collection, and sovereign debt negotiations.

Muthoo first discusses the Nash bargaining solution in Chapter 2. We learn that (in the simplest case, given risk-neutrality) two parties divide a cake of size 100 by giving each party the amount he would get if there were no agreement (say, 10 and 70), plus half of the surplus that remains over and above the disagreement point (i.e., 50% of $100 - 10 - 70 = 20$ and the parties get 20 and 80, respectively). This bargaining solution is motivated by plausible axioms (invariance to equivalent utility representations, Pareto efficiency, symmetry, and independence of irrelevant alternatives).

In Chapters 3–6, Rubinstein's non-cooperative bargaining game and several extensions are presented. In this game a player makes an offer which the other player can accept or reject. In the latter case, time passes and the second player makes a counteroffer, and so on. The players discount future payoffs. In the unique subgame perfect equilibrium the players immediately agree on a division of the cake. If the time interval between offers tends to zero, the equilibrium shares of the players only depend on the relative size of their discount rates (a relatively more patient player receives a larger share, because his costs of haggling are smaller). If the discount rates are identical, the cake is split 50:50 (i.e., according to the Nash bargaining solution with the disagreement point 0,0). If there is no discounting, but bargaining can break down due to an exogenous event yielding payoffs 10 and 70, the players split the cake according to the Nash bargaining solution with the disagreement point (10,70). If there is discounting and a party can, in addition to rejecting an offer and making a counteroffer, also reject and opt out yielding payoffs (10,70), then the cake is split according to the outside option principle: When the discount rates are equal and time intervals between offers converge to zero, the party who could get more than 50 receives its outside option payoff

Bargaining Theory with Applications Abhinay Muthoo, 1999-08-19 Graduate textbook presenting abstract models of bargaining in a unified framework with detailed applications involving economic political and social situations *Bilateral Bargaining* Stefan Napel, 2002-04-10 This book investigates bargaining between two agents Its objective is to present to extend and to apply the present state of theoretical knowledge A wide range of questions will be considered First of all will two parties reach efficient agreements Traditional economic theory gives a generally affirmative answer for perfectly rational agents who can carry out complex calculations instantaneously and without cost The book uses innovative methods to analyse the implications of less demanding assumptions A practical question related to bargaining is How much power does the design of institutions such as the U N Security Council give to each of its members Formally non permanent members votes are necessary to pass resolutions but theoretical investigation of pre voting negotiation attributes all power to the five permanent members Or one may ask whether a society should rather finance the education in higher mathematics for a talented person than remedial training for a retarded person Different concepts of justice yield different answers Which particular concept is implemented in a given society is also a matter of bargaining and it is of special philosophical interest to investigate which bargain will be struck in an ideal society in which individual talents and resources are not yet known Very generally a bilateral bargaining situation is characterized by two agents individuals firms governments etc *Game Theory And Mechanism Design* Y Narahari, 2014-03-13 This book offers a self sufficient treatment of a key tool game theory and mechanism design to model analyze and solve centralized as well as decentralized design problems involving multiple autonomous agents that interact strategically in a rational and intelligent way The contents of the book provide a sound foundation of game theory and mechanism design theory which clearly represent the science behind traditional as well as emerging economic applications for the society The importance of the discipline of game theory has been recognized through numerous Nobel prizes in economic sciences being awarded to game theorists including the 2005 2007 and 2012 prizes The book distills the marvelous contributions of these and other celebrated game theorists and presents it in a way that can be easily understood even by senior undergraduate students A unique feature of the book is its detailed coverage of mechanism design which is the art of designing a game among strategic agents so that a social goal is realized in an equilibrium of the induced game Another feature is a large number of illustrative examples that are representative of both classical and modern applications of game theory and mechanism design The book also includes informative biographical sketches of game theory legends and is specially customized to a general engineering audience After a thorough reading of this book readers would be able to apply game theory and mechanism design in a principled and mature way to solve relevant problems in computer science esp artificial intelligence machine learning computer engineering operations research industrial engineering and microeconomics *Optimization and Games for Controllable Markov Chains* Julio B. Clempner, Alexander

Poznyak,2023-12-13 This book considers a class of ergodic finite controllable Markov s chains The main idea behind the method described in this book is to develop the original discrete optimization problems or game models in the space of randomized formulations where the variables stand in for the distributions mixed strategies or preferences of the original discrete pure strategies in the use The following suppositions are made a finite state space a limited action space continuity of the probabilities and rewards associated with the actions and a necessity for accessibility These hypotheses lead to the existence of an optimal policy The best course of action is always stationary It is either simple i e nonrandomized stationary or composed of two nonrandomized policies which is equivalent to randomly selecting one of two simple policies throughout each epoch by tossing a biased coin As a bonus the optimization procedure just has to repeatedly solve the time average dynamic programming equation making it theoretically feasible to choose the optimum course of action under the global restriction In the ergodic cases the state distributions generated by the corresponding transition equations exponentially quickly converge to their stationary final values This makes it possible to employ all widely used optimization methods such as Gradient like procedures Extra proximal method Lagrange s multipliers Tikhonov s regularization including the related numerical techniques In the book we tackle different problems and theoretical Markov models like controllable and ergodic Markov chains multi objective Pareto front solutions partially observable Markov chains continuous time Markov chains Nash equilibrium and Stackelberg equilibrium Lyapunov like function in Markov chains Best reply strategy Bayesian incentive compatible mechanisms Bayesian Partially Observable Markov Games bargaining solutions for Nash and Kalai Smorodinsky formulations multi traffic signal control synchronization problem Rubinstein s non cooperative bargaining solutions the transfer pricing problem as bargaining
