National Science Foundation (U.S.),1971 **The Cauchy Problem in General Relativity** Hans Ringström,2009 The general theory of relativity is a theory of manifolds equipped with Lorentz metrics and fields which describe the matter content Einstein s equations equate the Einstein tensor a curvature quantity associated with the Lorentz metric with the stress energy tensor an object constructed using the matter fields In addition there are equations describing the evolution of the matter Using symmetry as a guiding principle one is naturally led to the Schwarzschild and Friedmann Lemaitre Robertson Walker solutions modelling an isolated system and the entire universe respectively In a different approach formulating Einstein s equations as an initial value problem allows a closer study of their solutions This book first provides a definition of the concept of initial data and a proof of the correspondence between initial data and development It turns out that some initial data allow non isometric maximal developments complicating the uniqueness issue The second half of the book is concerned with this and related problems such as strong cosmic censorship The book presents complete proofs of several classical results that play a central role in mathematical relativity but are not easily accessible to those without prior background in the subject Prerequisites are a good knowledge of basic measure and integration theory as well as the

fundamentals of Lorentz geometry The necessary background from the theory of partial differential equations and Lorentz geometry is included **Elementary Differential Geometry** Barrett O'Neill,2006 Written primarily for students who have completed first courses in calculus and linear algebra this textbook provides an introduction to the geometry of curves and surfaces This revised second edition gives an update of commands for the symbolic computation programs Mathematica or Maple

Geometric Relativity Dan A. Lee,2021-12-20 Many problems in general relativity are essentially geometric in nature in the sense that they can be understood in terms of Riemannian geometry and partial differential equations This book is centered around the study of mass in general relativity using the techniques of geometric analysis Specifically it provides a comprehensive treatment of the positive mass theorem and closely related results such as the Penrose inequality drawing on a variety of tools used in this area of research including minimal hypersurfaces conformal geometry inverse mean curvature flow conformal flow spinors and the Dirac operator marginally outer trapped surfaces and density theorems This is the first time these topics have been gathered into a single place and presented with an advanced graduate student audience in mind several dozen exercises are also included The main prerequisite for this book is a working understanding of Riemannian geometry and basic knowledge of elliptic linear partial differential equations with only minimal prior knowledge of physics required The second part of the book includes a short crash course on general relativity which provides background for the study of asymptotically flat initial data sets satisfying the dominant energy condition
