

ELECTRICITY

Electricity is the flow of electrons through a material.

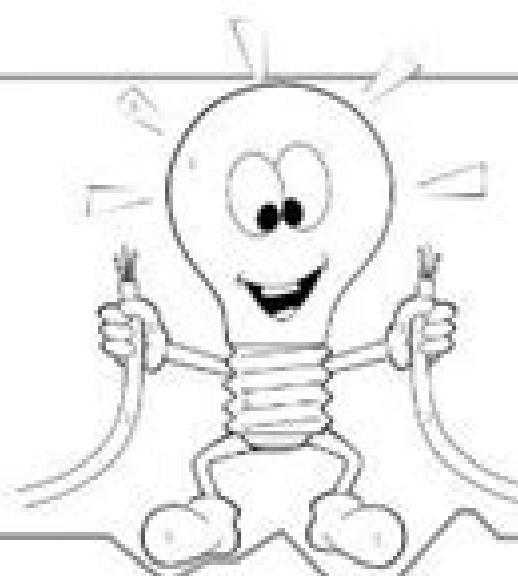

The movement of these tiny electrons gives us a special type of energy which is used to power lights, heat, sound, movement etc. Many of the products which we use every day such as televisions, phones and microwaves would not be possible without electricity.

The flow of electrons through a material is better known as an electric current. An electric current can flow through some materials but not others.

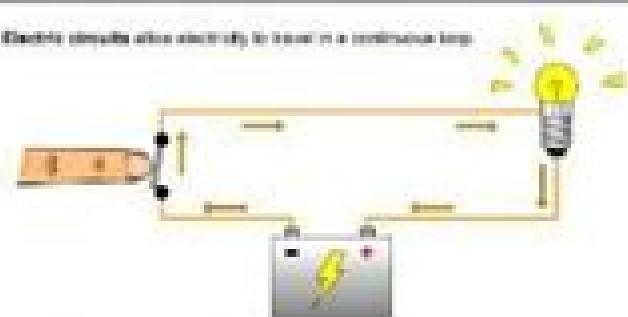

Conductors allow electricity to flow freely through a material. Most metals are very good conductors of electricity as well as water.

Insulators do not allow electricity to pass through. Materials such as wood, plastic and rubber are excellent insulators.

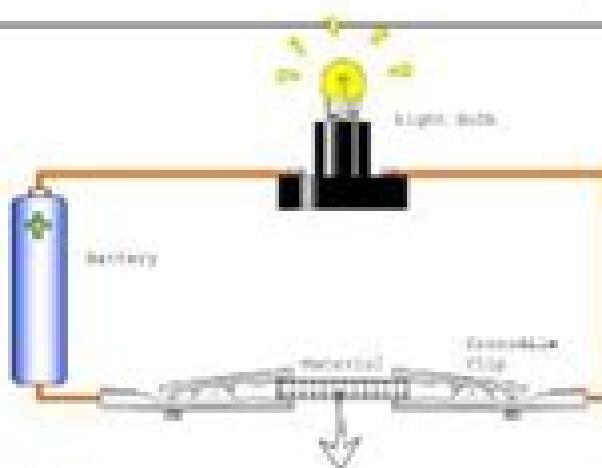

Engineers use this understanding of conductors and insulators to design circuits. Circuits make it possible for electricity to do useful work by allowing the energy from one place to another, powering our lights, computers etc.

Electric circuits allow electricity to flow in a continuous loop.

The electric current passes through components which are connected using conductive wires in a loop from one end of the battery to the other. The path of the electric current must be continuous but can be broken using a switch. This switch opens and closes the loop, turning the circuit on and off.
