Advanced Composites

Viktor Gribniak,2021-06-02 Engineering practice has revealed that innovative technologies structural applications require

new design concepts related to developing materials with mechanical properties tailored for construction purposes. This would allow the efficient use of engineering materials. The efficiency can be understood in a simplified and heuristic manner as the optimization of performance and the proper combination of structural components leading to the consumption of the least amount of natural resources. The solution to the eco optimization problem based on the adequate characterization of the materials will enable implementing environmentally friendly engineering principles when the efficient use of advanced materials guarantees the required structural safety. Identifying fundamental relationships between the structure of advanced composites and their physical properties is the focus of this book. The collected articles explore the development of sustainable composites with valorized manufacturability corresponding to Industrial Revolution 4.0 ideology. The publications amongst others reveal that the application of nano particles improves the mechanical performance of composite materials. Heat resistant aluminium composites ensure the safety of overhead power transmission lines. Chemical additives can detect the impact of temperature on concrete structures. This book demonstrates that construction materials choice has considerable room for improvement from a scientific viewpoint following heuristic approaches.

Modern Techniques in Bridge Engineering Khaled Mahmoud, 2011-08-26. Due to significant economic growth in the last few decades increasing traffic loads impose tremendous demand on bridge structures. This coupled with ongoing deterioration of bridges introduces a unique challenge to bridge engineers in maintaining service of these infrastructure assets without disruption to vital economic and social activities. This requires innovative solutions and optimized methodologies to achieve safe and efficient operation of bridge structures. Bridge engineering practitioners, researchers, owners and contractors from all over the world presented on modern techniques in design, inspection, monitoring and rehabilitation of bridge structures at the Sixth New York City Bridge Conference held in New York City on July 25-26, 2011. This book contains a select number of papers presented at the conference. This group of papers provides a state of the art in bridge engineering and is of interest to any reader in the field.

Structural Integrity and Failure Resat Oyguc, Faham Tahmasebinia, 2021-02-10. Structural integrity and failure assessment have been considered by many fields of engineers as it is a multi-disciplinary concept. The assessment procedure vitally ensures that structural elements will remain functional throughout their service lives. Structural failure refers to the loss of structural integrity by means of loss at the component or system level elements. The main concern of integrity assessment is that a structural failure may be avoided at the service level by designing the structure to withstand its designated loads. Hence for satisfactory structural performance, structural safety, failure and interaction between them should be considered throughout the design and analysis stages. This book is a collection of chapters that provide the researcher with a comprehensive perspective on structural integrity and its sub-disciplines.
