 individual papers on the development of intensive methods of rearing animals Starting from the original domestication of  
 what are known as farm animals the authors consider the effect on the ecosystem of the new method of housing animals the  
 changes in animal types as a remit of selective breeding and the new programmes for the effective feeding of animals In  
 addition the effect of intensive management on animal behaviour and disease incidence is discussed for poultry pigs and  
 cattle The consideration of bioindustrial ecosystems in this volume concentrates on systems which while being true  
 ecosystems differ considerably from those dealt with in the other volumes of this series The points of similarity concern the  
 relationship between one organism and another and their interaction with the environment The points of difference relate to  
 the major role of man as an organism in bioindustrial ecosystems and the nature of the artificial environment that he has  
 created for his animals The involvement of man is related to the domestication of animals and his use of them for such things  
 as food traction transport clothing fertiliser and recreation Man s use of animals in different parts of the world varies  
 considerably and is influenced by a number of factors which include climate wealth availability of water customs and religion  
 Probably the developments in bioindustry during this century show a greater change in an ecosystem over a short time than  
 any other As man further develops bioindustry to meet his needs so the place of the animal in the ecosystem assumes greater  
 importance in relation to its own well being Using an international approach the authors have compiled a comprehensive  
 study which will act as an important reference for political and ecological discussions on the future of animal production
