Numerical and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment Umer Afzal,2017 There are many sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment. There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow. The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread. The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment. This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model. One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time-consuming experimentation efforts **ANSYS Dynamics** Swanson Analysis Systems,1993 *Computational Methods in*

Nonlinear Structural and Solid Mechanics Ahmed K. Noor, Harvey G. McComb, 2014-05-20 Computational Methods in Nonlinear Structural and Solid Mechanics covers the proceedings of the Symposium on Computational Methods in Nonlinear Structural and Solid Mechanics. The book covers the development of efficient discretization approaches, advanced numerical methods, improved programming techniques, and applications of these developments to nonlinear analysis of structures and solids. The chapters of the text are organized into 10 parts according to the issue they tackle. The first part deals with nonlinear mathematical theories and formulation aspects, while the second part covers computational strategies for nonlinear programs. Part 3 deals with time integration and numerical solution of nonlinear algebraic equations, while Part 4 discusses material characterization and nonlinear fracture mechanics. Part 5 tackles nonlinear interaction problems. The sixth part discusses seismic response and nonlinear analysis of concrete structure, and the seventh part tackles nonlinear problems for nuclear reactors. Part 8 covers crash dynamics and impact problems, while Part 9 deals with nonlinear problems of fibrous composites and advanced nonlinear applications. The last part discusses computerized symbolic manipulation and nonlinear analysis software systems. The book will be of great interest to numerical analysts, computer scientists, structural engineers, and other professionals concerned with nonlinear structural and solid mechanics.

Bay Springs Lock and Dam located in northeast Mississippi is the northernmost of the system of locks and dams on the Tennessee Tombigbee Waterway. The navigation lock will be formed by a combination of anchored chambered walls and gravity type gate blocks with a reinforced concrete floor strut. The anchored wall monoliths differ from conventional gravity type monoliths in that posttensioned tendons engaging rock account in part for the stability of the walls. The anchored wall with its concrete foundation tendon interaction characteristics poses a formidable challenge to analysis by classical methods, making it an ideal problem for solution by a computerized numerical analysis technique. Due to the complex geometry of the structure, multiple materials, posttensioning of the tendons, and the attendant boundary conditions, the finite element method was selected as the only viable analysis technique for determining the state of stress in the anchored wall monolith and its surrounding foundation. The ANSYS FEM program was used primarily to take advantage of its nonlinear boundary element, which was used to approximate the interaction at material interfaces. Solutions for the various load cases were displayed graphically in numerous pressure, stress, and deflected shape diagrams. Results confirm the assumption of the rigid body stability analysis program used to size the tendons of the anchored wall monolith and indicate a safe design with regard to
