O'Mara, 2013-11-11 We live in the silicon age and the quintessential item that defines our world is the computer Silicon chips power the computer as well as many other products for work and leisure such as calculators radios and televisions In the forty years since the transistor was invented the solid state revolution has affected the lives of almost everyone in the world Based on silicon solid state devices and integrated circuits have revolutionized electronics data processing communications and the like The computer especially the personal computer would be impossible without silicon devices Only one computer was ever built using vacuum tubes and the tubes had to be constantly replaced because they generated too much heat and burned out Silicon devices allowed for reliable switching operations in arrays of hundreds and thousands of discrete devices As a result the very substantial industrial base that existed for producing vacuum tubes disappeared with one exception That exception is of course the CRT which is evident in televisions computer displays and a host of other information display terminals Until recently there was nothing that could take its place and it seemed that the CRT would remain as the electronic medium for all except the simplest displays The CRT is about to go the way of the other vacuum tubes It s dead but doesn t know it yet Liquid Crystal Displays Robert H. Chen, 2011-08-04 An unprecedented look into the basic physics chemistry and technology behind the LCD Most notably used for computer screens televisions and mobile phones LCDs liquid crystal displays are a pervasive and increasingly indispensable part of our lives Providing both an historical and a business minded context this extensive resource describes the unique scientific and engineering techniques used to create these beautiful clever and eminently useful devices In this book the history of the science and technology behind the LCD is described in a prelude to the development of the device presenting a rational development theme and pinpointing innovations The book begins with Maxwell s theory of electromagnetism and the ultimately profound realization that light is an electromagnetic wave and an electromagnetic wave

is light The power of mathematical physics thus was brought to bear upon the study of light and particularly the polarization of light by material bodies including liquid crystals After a brief historical description of polarization a physical interpretation provides substance to the mathematical concepts Subsequent chapters cover Thermodynamics for liquid crystals The Maier Saupe mean field phenomenological static continuum and dynamic continuum theories The transistor and integrated circuit Glass panels and modules The calculus of variations The active matrix Semiconductor fabrication The global LCD business Additionally the book illustrates how mathematics physics and chemistry are put to practical use in the LCDs we use every day By describing the science from an historical perspective and in practical terms in the context of a device very familiar to readers the book presents an engaging and unique view of the technology for everyone from science students to engineers product designers and indeed anyone curious about LCDs Series Editor Anthony C Lowe The Lambent Consultancy Braishfield UK The Society for Information Display SID is an international society which has the aim of encouraging the development of all aspects of the field of information display Complementary to the aims of the society the Wiley SID series is intended to explain the latest developments in information display technology at a professional level The broad scope of the series addresses all facets of information displays from technical aspects through systems and prototypes to standards and ergonomics

High Efficiency Active Matrix Liquid Crystal Displays (HEAMLCD), 2003 This high efficiency active matrix liquid crystal display HEAMLCD effort examined several alternatives to increasing the total power efficiency of an AMLCD flat panel display FPD It was determined that the color filters passed just one sixth of incident light and that a re design of the addressed cell assembly ACA based on color separation physical phenomena represented the best new technology opportunity to improve overall display power efficiency Current liquid crystal display LCD sub pixels are covered by red green or blue absorptive color filters this method discards two thirds of available white light by structure while transmitting just 50% of the desired color Micro optical elements based on refractive diffractive or interferometric color separation were selected for pursuit in this effort A diffractive color separation filter DCSF was designed to separate the colors and focus the desired red green blue wavelength bands onto the subpixel apertures The black matrix already used in AMLCD designs is used to block the spill over of undesired wavebands from adjacent subpixels Several prototypes of a DCSF were designed fabricated tested analyzed and reported An alternative approach using reflective color separation RCS dichroic filters was also tested Several other potential techniques for improving the efficiency of AMLCD displays including inorganic light emitting diode LED backlight technology were examined and are discussed
