Motivated by the rapid evolution of the consecutive generations of wireless communication systems this volume continues to provide an overview of the majority of single and multi carrier QAM techniques Now fully revised and updated with more than 300 pages of new material this new edition presents the wide range of recent developments in the field and places particular emphasis on the family of coded modulation aided OFDM and CDMA schemes In addition it also includes a fully revised chapter on adaptive modulation and a new chapter characterizing the design trade offs of adaptive modulation and space time coding Divided into four parts Part I commences with a historical perspective and classic schemes for the uninitiated Part II offers a deep discourse on adaptive QAM arrangements that have found their way also into the 3G system's High Speed Data Packet Access HSDPA mode Part III details the advanced intricacies of adaptive versus space time block and trellis coded OFDM and MC CDMA Part IV contains previously unpublished new research results It commences with a

theoretical chapter on the capacity of wireless channels. The discussions then continue by contriving sophisticated iterative coded modulation systems such as TCM, TTCM, BICM, BICM ID designed for turbo detected QAM based space time coded OFDM and CDMA systems operating over wireless channels. In summary this volume amalgamates a comprehensive textbook with a deep research monograph on the topic of QAM ensuring it has a wide ranging appeal for both senior undergraduate and postgraduate students as well as practicing engineers and researchers.

Emona-based Interactive Amplitude

Modulation/demodulation ILab Edison M. Achelengwa, Massachusetts Institute of Technology, Department of Electrical Engineering and Computer Science, 2011. The MIT iLab Project has developed online laboratories iLabs which are lab stations that can be accessed and controlled remotely over the Internet. With iLabs students can conduct real experiments on real equipment over the Internet. With the introduction of the National Instrument's Educational Laboratory Virtual Instrument Suite NI ELVIS in the development of iLabs students gain a better understanding of engineering concepts by obtaining real data from electronic labs. One of such crucial engineering concepts is telecommunications which plays a key role in transmitting information between people, systems and computers. There are many telecommunication schemes which exist today. The iLab developed in this thesis implements an experiment for studying one of such schemes Amplitude Modulation. The NI ELVIS is used together with a device called the Emona Digital and Analog Telecommunications Experimenter DATEx to achieve the Amplitude Modulation lab setup. This iLab is an Interactive iLab which gives one student at a time complete real time control over the lab set up. The Amplitude Modulation iLab will permit students to tune various controls and observe the behavior and changes of relevant signals both in time domain and frequency domain. It will also permit students to compare different signals and retrieve data locally for post processing.

Predistortion of Quadrature Amplitude Modulation

Signals Using Volterra Series Approximation Michael T. Donovan, 1996-12-01. Modern digital communication systems are being called upon to move ever increasing amounts of information over decreasingly available bandwidth. This requires that communication systems employ bandwidth efficient modulation schemes to conserve bandwidth while moving the information at higher data rates. A major stumbling block to using higher order modulation schemes in long haul communication is the distortion caused by high power amplifiers. These high power amplifiers are required to amplify the signal power to a level that will allow distant receivers to correctly demodulate and decode the information. The distortion caused by the high power amplifiers can render a modulation scheme unusable due to the high symbol error rates which result from the extensive skewing of the modulation scheme's signal constellation. This thesis details a predistortion technique using Volterra series approximation techniques to model the inverse of the high power amplifier's distortion characteristics. A 64 Quadrature Amplitude Modulation (64 QAM) system incorporating a predistorter is used to demonstrate the ability to achieve acceptable bit error rates. The implementation of the inverse model and the communication system is performed in MATLAB. The results show the viability of predistortion of digital data to allow the higher order modulation.
